## Oracle MySQL HeatWave Implementation Associate Rel 1 Sample Questions (Q41-Q46):

### NEW QUESTION # 41

You run this command to connect successfully to a DB system:  
`mysqlsh john@10.0.1.122 --auth-method=authentication_oci_client`  
Why does the command NOT require a password?

- A. The correct API key-pair is specified in the `-.oci.config` file.
- B. The correct password is saved in the local MySQL Shell secret store.
- C. The credential is stored in an OCI vault secret.

- D. The operating system user credential is used to authenticate with the DB system.

**Answer: A**

Explanation:

The command `mysqlsh john@10.0.1.122 --auth-method=authentication_oci_client` does not require a password because it uses the OCI (Oracle Cloud Infrastructure) client authentication method. This method relies on the correct API key-pair specified in the `~/oci/configfile`. This file contains the necessary credentials (user OCID, tenancy OCID, API keys, etc.) to authenticate with the OCI environment without needing a password for each connection.

#### NEW QUESTION # 42

Which two are available when creating a new MySQL DB system in OCI Console? (Choose two.)

- A. High availability
- B. Lakehouse
- C. Standalone server
- D. Read replica
- E. HeatWave cluster

**Answer: A,C**

Explanation:

When creating a new MySQL DB system in the OCI Console, you have the following options:

- \* High availability (Answer A): This option allows you to create a DB system that can automatically fail over to a standby instance in case of hardware or software failure, ensuring minimal downtime.
- \* Standalone server (Answer C): This option lets you create a DB system with a single instance, suitable for workloads that do not require high availability or read replicas.

#### NEW QUESTION # 43

Automatic backup retention of a DB system is disabled. Which operation deletes all automatic backups of the DB system?

- A. Disabling point-in-time recovery
- B. Deleting the DB system
- C. Disabling delete protection
- D. Enabling point-in-time recovery

**Answer: B**

Explanation:

When automatic backup retention of a DB system is disabled, deleting the DB system (Answer B) will delete all automatic backups of the DB system.

- \* Automatic Backups: These are backups created automatically by the OCI service to ensure data protection.
- \* Backup Deletion: If automatic backups are disabled and you delete the DB system, all associated automatic backups are also deleted. This operation is irreversible, and you should ensure that necessary backups are taken before deleting the DB system.

#### NEW QUESTION # 44

Which is true about changing the storage size of a DB system?

- A. The DB system shuts down during the resize operation.
- B. You cannot decrease the DB system's storage size.
- C. You must stop the DB system before changing its storage size.
- D. You must increase the DB system's storage size in multiples of 100 GB.

**Answer: B**

Explanation:

When changing the storage size of a DB system, you cannot decrease the DB system's storage size (Answer B).

This restriction ensures data integrity and prevents potential data loss that could occur if the storage size were reduced.

\* You can only increase the storage size of the DB system.

\* The storage increase is done online without shutting down the DB system, allowing for uninterrupted operations.

#### NEW QUESTION # 45

Which two are benefits of read replicas? (Choose two.)

- **A. Scale read queries.**
- B. Reduce network latency.
- **C. Reduce query latency.**
- D. Reduce down time.
- E. Speed up analytical queries.

**Answer: A,C**

Explanation:

A.Reduce query latency: By distributing read queries across multiple replicas, the load on the primary instance is reduced, which can decrease query latency. D.Scale read queries: Read replicas allow scaling of read operations by providing additional instances to handle read queries, improving overall performance and throughput.
