1 / 5

In fact, our ACD201 exam materials provide comprehensive customers service, and our commitment to users does not end at the point of sale. If you have any questions related to our ACD201 exam materials, you can always consult our customer service. Our customer service is 24 hours online and will answer your questions in the shortest possible time. Our ACD201 Exam Materials assure you that we will provide the best service before you pass the ACD201 exam. RealValidExam will never disappoint you. Therefore, you can prepare real ACD201 exams using the actual ACD201 exam questions. This is indeed a huge opportunity. Don't miss it!

Appian ACD201 Exam Syllabus Topics:

Topic	Details
Topic 1	• Data Management: This section of the exam measures the skills of Solution Architects and covers designing and documenting data models, recommending record types for optimization and security, working with relational data, and implementing complex models with supporting objects.
Topic 2	• Performance and Scalability: This section of the exam measures the skills of Appian Developers and covers designing performant components, building memory-efficient models, conducting database load and automated testing, analyzing server memory and logs for risks, and resolving performance concerns for end users.

Topic 3	• Application Design and Development: This section of the exam measures the skills of Appian Developers and covers translating business requirements into user stories, building end-to-end applications, managing object security, applying design best practices, and ensuring user-centric experiences through proper UX design.
Topic 4	• Advanced Appian Concepts: This section of the exam measures the skills of Solution Architects and covers creating and configuring authentication methods, setting up integration objects, designing APIs, evaluating smart services and plug-ins, and applying SSO mechanisms with SAML and LDAP.

Free PDF Quiz Marvelous Appian ACD201 Reliable Exam Simulations

If you can have the certification, you can enter the company you like as well as improve your salary. ACD201 training materials of us can offer you such opportunity, since we have a professional team to compile and verify, therefore ACD201 exam materials are high quality. You can pass the exam just one time. In addition, ACD201 Exam Dumps contain both questions and answers, so that you can have a quick check after practicing. We offer you free update for one year, and the update version for ACD201 exam materials will be sent to your email address automatically.

Appian Senior Developer Sample Questions (Q90-Q95):

NEW QUESTION # 90

You're creating a process model that will serve as the case creation workflow.

Your requirements:

This process captures input from the user before executing a series of unattended subprocess nodes.

Each subprocess performs extended data processing which is dependent on output from each of the previous nodes.

An activity chained task node is displayed asking the user if they'd like to create another case.

What should you do?

- A. Combine the separate subprocesses into one synchronous subprocess and place it in between each user input task.
- B. Configure the subprocess nodes to run asynchronously and set the inputs to pass as reference to enable data sharing.
- C. Add an AND gate after the first user input task and place the synchronous subprocess nodes on a parallel path.

Answer: A

Explanation:

Combining the separate subprocesses into one synchronous subprocess and placing it between each user input task ensures each subprocess's output is available for the next step, maintaining data dependencies and supporting the required user experience with activity chaining.

NEW QUESTION # 91

What are three ways to optimize the memory usage of a process model? (Choose three.)

- A. Pass data directly to activity nodes and smart services.
- B. Avoid storing large blocks of text in process variables.
- C. Configure process variables as parameters.
- D. Decrease the number of process variables.
- E. Minimize the use of subprocesses in the model.
- F. Divide large nodes into multiple smaller nodes.

Answer: A,B,C

Explanation:

Passing data directly to activity nodes and smart services reduces unnecessary use of process variables, optimizing memory.

Configuring process variables as parameters limits their lifespan and persistence, saving memory.

Avoiding large blocks of text in process variables minimizes memory consumption within the process model.

NEW QUESTION # 92

An application consists of a record type with sync enabled. This record type is used as a source to create a read-only grid. A field "Number of days since created" is configured in the interface and a logic is implemented to calculate the number of days since a record is created in the application.

You need to implement sorting on this field.

What should you do?

- A. Create a custom record type field and use it in the sorting configuration.
- B. Add sortField: "Number of days since created" configuration for the gridColumn that needs to be sorted.
- C. Sorting is not possible on custom record type fields. Instead, create a view with a custom field and use the field from the view for sorting.

Answer: A

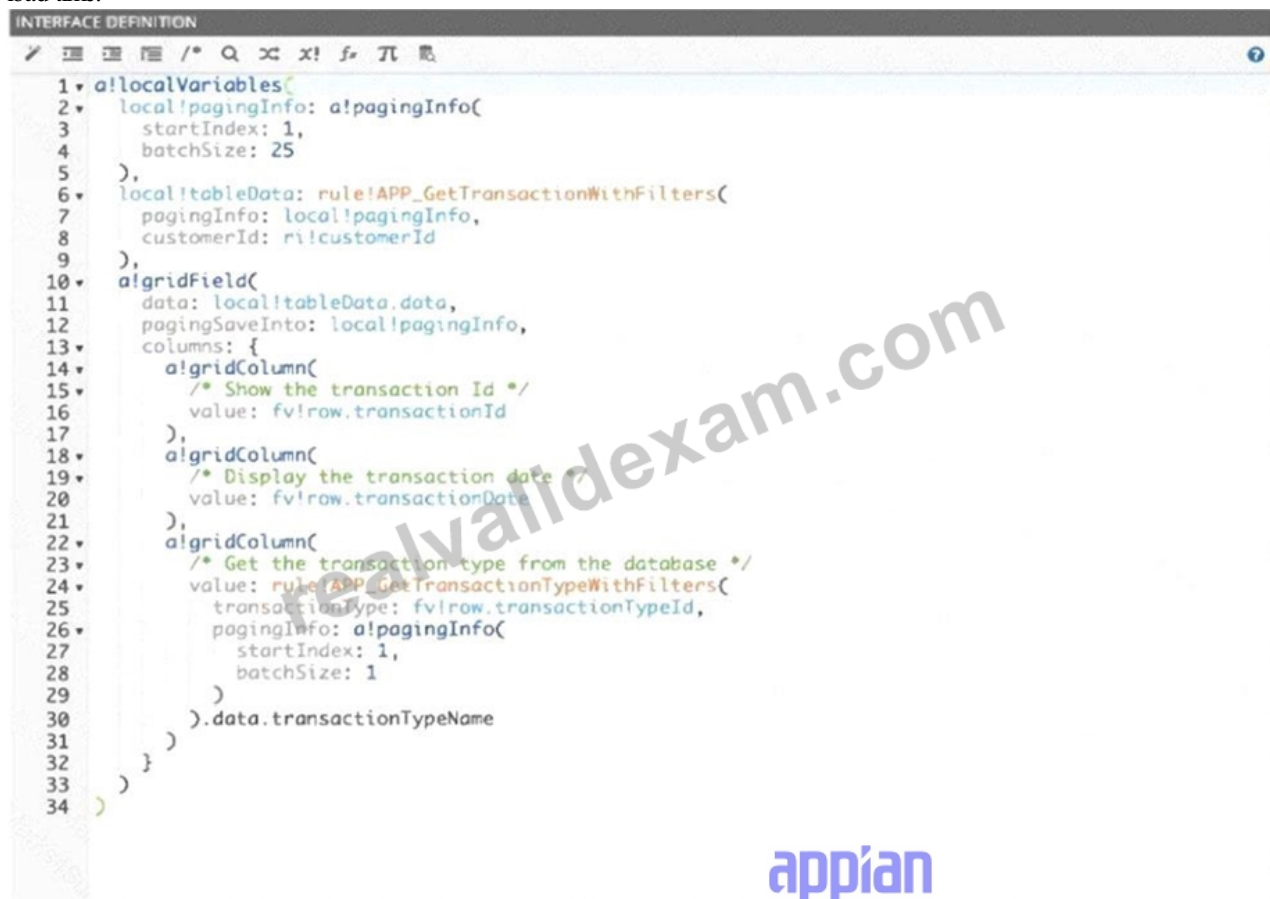

Explanation:

Creating a custom record type field to calculate "Number of days since created" allows you to use this field in the sorting configuration of your read-only grid.

NEW QUESTION # 93

Users are experiencing slow load times when retrieving customer records with many transactions.

After using performance monitoring tools, you discover that the following interface definition is responsible for the majority of page load time:

```
INTERFACE DEFINITION
1 * a!localVariables(
2 *   local!pagingInfo: a!pagingInfo(
3 *     startIndex: 1,
4 *     batchSize: 25
5 *   ),
6 *   local!tableData: rule!APP_GetTransactionWithFilters(
7 *     pagingInfo: local!pagingInfo,
8 *     customerId: ri!customerId
9 *   ),
10 * a!gridField(
11 *   data: local!tableData.data,
12 *   pagingSaveInfo: local!pagingInfo,
13 *   columns: {
14 *     a!gridColumn(
15 *       /* Show the transaction Id */
16 *       value: fv!row.transactionId
17 *     ),
18 *     a!gridColumn(
19 *       /* Display the transaction date */
20 *       value: fv!row.transactionDate
21 *     ),
22 *     a!gridColumn(
23 *       /* Get the transaction type from the database */
24 *       value: rule!APP_GetTransactionTypeWithFilters(
25 *         transactionType: fv!row.transactionTypeId,
26 *         pagingInfo: a!pagingInfo(
27 *           startIndex: 1,
28 *           batchSize: 1
29 *         )
30 *       ).data.transactionTypeName
31 *     )
32 *   }
33 * )
34 )
```

Additionally, both queries (rule!APP_GetTransactionsWithFilters and rule!

APP_GetTransactionTypeWithFilters) take approximately 25 milliseconds each to execute when you test them using the expression editor.

Which action would result in the greatest reduction in the load time for this interface component?

- A. Prefetch transaction types and use the displayvalue() function to display the Transaction Type for each transaction.
- B. Use a synced record for Transactions to improve the query response time for the query performed on line 6.
- C. Avoid fetching the total count when getting transactions.

Answer: A

Explanation:

Prefetching all transaction types once (instead of running a separate query for each row in the grid) and then using the `displayvalue()` function to display the corresponding transaction type name for each transaction will significantly reduce the number of queries executed. This eliminates the N+1 query problem and will greatly improve the interface load time.

NEW QUESTION # 94

Your development team has selected Jenkins as a Continuous Integration (CI) system to integrate testing of Appian into your overall testing strategy.

What should you do to set up automated testing of expression rules using Jenkins?

Note: To answer, move all steps from the Options list to the Answer List area and arrange them in the correct order.

0

Test the end-to-end functionality of the created web APIs.

0

Create and test a web API with the `altestRunStatusForId()` function.

0

Create and test a web API with the `altestRunResultForId()` function.

0

Create and test a web API with the `alstartRuleTestsApplications()` function.

0

Create a new Appian application for "Continuous_Integration".

0
