Quiz 2025 Realistic SY0-701 Reliable Exam Pattern - CompTIA Security+ Certification Exam Exams Collection

In the era of rapid changes in the knowledge economy, do you worry that you will be left behind? Let's start by passing the SY0-701 exam. Getting a SY0-701 certificate is something that many people dream about and it will also bring you extra knowledge and economic benefits. The SY0-701 latest question we provide all candidates that that is compiled by experts who have good knowledge of exam, and they are very experience in compile study materials. Not only that, our team checks the update every day, in order to keep the latest information of SY0-701 Exam Question.

CompTIA Security+ Certification Exam Sample Questions (Q455-Q460):

NEW QUESTION # 455

An enterprise is trying to limit outbound DNS traffic originating from its internal network. Outbound DNS requests will only be allowed from one device with the IP address 10.50.10.25. Which of the following firewall ACLs will accomplish this goal?

- A. Access list outbound permit 0.0.0.0/0 0.0.0.0/0 port 53Access list outbound deny 10.50.10.25/32 0.0.0.0/0 port 53
- B. Access list outbound permit 10.50.10.25/32 0.0.0.0/0 port 53Access list outbound deny 0.0.0.0/0 0.0.0.0/0 port 53
- C. Access list outbound permit 0.0.0.0/0 10.50.10.25/32 port 53Access list outbound deny 0.0.0.0/0 0.0.0.0/0 port 53
- D. Access list outbound permit 0.0.0.0/0 0.0.0.0/0 port 53Access list outbound deny 0.0.0.0/0 10.50.10.25/32 port 53

Answer: B

Explanation:

A firewall ACL (access control list) is a set of rules that determines which traffic is allowed or denied by the firewall. The rules are processed in order, from top to bottom, until a match is found. The syntax of a firewall ACL rule is:

Access list <direction> <action> <source address> <destination address> <protocol> <port> To limit outbound DNS traffic originating from the internal network, the firewall ACL should allow only the device with the IP address 10.50.10.25 to send DNS requests to any destination on port 53, and deny all other outbound traffic on port 53. The correct firewall ACL is:

Access list outbound permit 10.50.10.25/32 0.0.0.0/0 port 53 Access list outbound deny 0.0.0.0/0 0.0.0.0/0 port 53 The first rule permits outbound traffic from the source address 10.50.10.25/32 (a single host) to any destination address (0.0.0.0/0) on port 53 (DNS). The second rule denies all other outbound traffic on port 532.

NEW QUESTION # 456

In a rush to meet an end-of-year business goal, the IT department was told to implement a new business application. The security engineer reviews the attributes of the application and decides the time needed to perform due diligence is insufficient from a cybersecurity perspective. Which of the following best describes the security engineer's response?

- A. Risk tolerance
- B. Risk importance
- C. Risk acceptance
- **D. Risk appetite**

Answer: D

Explanation:

Risk appetite refers to the level of risk that an organization is willing to accept in order to achieve its objectives. In this scenario, the security engineer is concerned that the timeframe for implementing a new application does not allow for sufficient cybersecurity due diligence. This reflects a situation where the organization's risk appetite might be too high if it proceeds without the necessary security checks.

NEW QUESTION # 457

An engineer needs to find a solution that creates an added layer of security by preventing unauthorized access to internal company resources. Which of the following would be the best solution?

- A. Proxy server
- B. Hypervisor
- C. RDP server
- **D. Jump server**

Answer: D

Explanation:

A jump server is a server that acts as an intermediary between a user and a target system. A jump server can provide an added layer of security by preventing unauthorized access to internal company resources. A user can connect to the jump server using a secure protocol, such as SSH, and then access the target system from the jump server. This way, the target system is isolated from the external network and only accessible through the jump server. A jump server can also enforce security policies, such as authentication, authorization, logging, and auditing, on the user's connection. A jump server is also known as a bastion host or a jump box.

NEW QUESTION # 458

Which of the following is the primary reason why false negatives on a vulnerability scan should be a concern?

- A. Vulnerabilities with a lower severity will be prioritized over critical vulnerabilities.
- **B. The system has vulnerabilities that are not being detected.**
- C. The system has vulnerabilities, and a patch has not yet been released.
- D. The time to remediate vulnerabilities that do not exist is excessive.

Answer: B

NEW QUESTION # 459

Which of the following automation use cases would best enhance the security posture of an organization by rapidly updating permissions when employees leave a company?

- A. Disabling access
- B. Escalating permission requests
- C. Reviewing change approvals
- D. Provisioning resources

Answer: A

Explanation:

Disabling access is an automation use case that would best enhance the security posture of an organization by rapidly updating permissions when employees leave a company. Disabling access is the process of revoking or suspending the access rights of a user account, such as login credentials, email, VPN, cloud services, etc.

Disabling access can prevent unauthorized or malicious use of the account by former employees or attackers who may have compromised the account. Disabling access can also reduce the attack surface and the risk of data breaches or leaks. Disabling access can be automated by using scripts, tools, or workflows that can trigger the action based on predefined events, such as employee termination, resignation, or transfer.

Automation can ensure that the access is disabled in a timely, consistent, and efficient manner, without relying on manual intervention or human error.
