SPLK-2002トレーニング & SPLK-2002参考書内容

世界大手の企業の中で、大部分の企業はSplunk製品を主として運用しています。だから、Splunkの認証を取得したら、激しい競争の中でもいい仕事を探せます。受験生は試験に合格したいなら、SPLK-2002問題集をしようするのは一番迅速の方法です。多くの受験生たちはこの方法を通して試験に合格しました。

Splunk Enterprise Certified Architect 認定 SPLK-2002 試験問題 (Q201-Q206):

質問 # 201

Which of the following clarification steps should be taken if apps are not appearing on a deployment client?
(Select all that apply.)

- A. Search for relevant events in splunkd.log of the deployment server.
- B. Check the content of SPLUNK_HOME/etc/apps of the deployment server.
- C. Check deploymentclient.conf of the deployment client.
- D. Check serverclass.conf of the deployment server.

正解: A、C、D

解説:

The following clarification steps should be taken if apps are not appearing on a deployment client:

* Check serverclass.conf of the deployment server. This file defines the server classes and the apps and configurations that they should receive from the deployment server. Make sure that the deployment client belongs to the correct server class and that the

server class has the desired apps and configurations.

* Check deploymentclient.conf of the deployment client. This file specifies the deployment server that the

* deployment client contacts and the client name that it uses. Make sure that the deployment client is pointing to the correct deployment server and that the client name matches the server class criteria.

* Search for relevant events in splunkd.log of the deployment server. This file contains information about the deployment server activities, such as sending apps and configurations to the deployment clients, detecting client check-ins, and logging any errors or warnings. Look for any events that indicate a problem with the deployment server or the deployment client.

* Checking the content of SPLUNK_HOME/etc/apps of the deployment server is not a necessary clarification step, as this directory does not contain the apps and configurations that are distributed to the deployment clients. The apps and configurations for the deployment server are stored in SPLUNK_HOME/etc/deployment-apps. For more information, see Configure deployment server and clients in the Splunk documentation.

質問 # 202

Which Splunk internal index contains license-related events?

_audit

- A. _introspection
- B. _license
- C. **_internal**

正解: C

解説:

Explanation/Reference: <https://answers.splunk.com/answers/579494/how-to-display-license-consumed-by-an-index-over-2.html>

質問 # 203

Which of the following tasks should the architect perform when building a deployment plan? (Select all that apply.)

- A. Use case checklist.
- B. Install Splunk apps.
- C. **Review network topology.**
- D. Inventory data sources.

正解: C

解説:

Explanation/Reference:

質問 # 204

By default, what happens to configurations in the local folder of each Splunk app when it is deployed to a search head cluster?

- A. The local folder is ignored and only the default folder is copied to the search heads.
- B. The local folder is copied to the local folder on the search heads.
- C. Only certain .conf files in the local folder are deployed to the search heads.
- D. **The local folder is merged into the default folder and deployed to the search heads.**

正解: D

解説:

A search head cluster is a group of Splunk Enterprise search heads that share configurations, job scheduling, and search artifacts¹. The deployer is a Splunk Enterprise instance that distributes apps and other configurations to the cluster members¹. The local folder of each Splunk app contains the custom configurations that override the default settings². The default folder of each Splunk app contains the default configurations that are provided by the app².

By default, when the deployer pushes an app to the search head cluster, it merges the local folder of the app into the default folder and deploys the merged folder to the search heads³. This means that the custom configurations in the local folder will take precedence over the default settings in the default folder. However, this also means that the local folder of the app on the search heads will be empty, unless the app is modified through the search head UI³.

Option B is the correct answer because it reflects the default behavior of the deployer when pushing apps to the search head cluster. Option A is incorrect because the local folder is not copied to the local folder on the search heads, but merged into the default folder. Option C is incorrect because all the .conf files in the local folder are deployed to the search heads, not only certain ones. Option D is incorrect because the local folder is not ignored, but merged into the default folder.

質問 # 205

Indexing is slow and real-time search results are delayed in a Splunk environment with two indexers and one search head. There is ample CPU and memory available on the indexers. Which of the following is most likely to improve indexing performance?

- **A. Increase the number of parallel ingestion pipelines in server.conf**
- B. Decrease the maximum size of the search pipelines in limits.conf
- C. Increase the maximum number of hot buckets in indexes.conf
- D. Decrease the maximum concurrent scheduled searches in limits.conf

正解: A

解説:

Explanation

Increasing the number of parallel ingestion pipelines in server.conf is most likely to improve indexing performance when indexing is slow and real-time search results are delayed in a Splunk environment with two indexers and one search head. The parallel ingestion pipelines allow Splunk to process multiple data streams simultaneously, which increases the indexing throughput and reduces the indexing latency. Increasing the maximum number of hot buckets in indexes.conf will not improve indexing performance, but rather increase the disk space consumption and the bucket rolling time. Decreasing the maximum size of the search pipelines in limits.conf will not improve indexing performance, but rather reduce the search performance and the search concurrency. Decreasing the maximum concurrent scheduled searches in limits.conf will not improve indexing performance, but rather reduce the search capacity and the search availability. For more information, see Configure parallel ingestion pipelines in the Splunk documentation.
