Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q35-Q40):

NEW QUESTION # 35

What is a limitation of the Network Security Groups (NSGs) in Azure?

- A. NSGs are applied only to vNICs.
- B. NSGs allow the filtering of inbound traffic only.
- C. NSGs cannot be applied to individual virtual machines.
- D. NSGs operate at the application layer, limiting their effectiveness in the network layer.

Answer: A

Explanation:

A limitation of NSGs is that they are applied only at the subnet level or to network interfaces (vNICs), not directly to other resources like load balancers or application gateways. This means granular application-layer filtering is not supported, and NSGs primarily operate at Layers 3 and 4.

NEW QUESTION # 36

What is a key advantage of the branch-to-hub to hub-to-branch topology in an Azure virtual WAN?

- A. Enhanced scalability enables communication between branch offices
- B. Improved branch-to-branch communication for faster data transfer
- C. Increased security through isolated connections between branches and hubs
- D. Load balancing enabled by the simultaneous connection of each branch to multiple hubs

Answer: B

Explanation:

The branch-to-hub to hub-to-branch topology in Azure Virtual WAN enables efficient branch-to-branch communication by routing traffic through connected hubs. This improves data transfer speed and reliability between branches without needing direct connections between all sites, simplifying management while maintaining performance.

NEW QUESTION # 37

What characterizes the branch-to-branch topology in an Azure virtual WAN?

- A. Improved scalability for branch offices connecting to Azure
- B. Enhanced security through centralized traffic management
- C. Increased redundancy through multiple connections to the central hub
- D. Simplified network architecture with reduced hub dependencies

Answer: A

Explanation:

The branch-to-branch topology in Azure Virtual WAN is characterized by direct connectivity between branches through the Virtual WAN backbone, which reduces dependency on centralized hubs. This results in a simplified network architecture, lowering latency and optimizing routing between branch locations.

NEW QUESTION # 38

Your organization is in the process of optimizing its Azure network architecture and wants to dynamically manage and exchange routing information between its virtual networks and on-premises networks.

Which Azure service would help to provide a centralized point for efficient route management and dynamic routing?

- A. Azure Virtual WAN
- **B. Azure Route Server**
- C. Azure ExpressRoute
- D. Azure VPN Gateway

Answer: B

Explanation:

Azure Route Server enables dynamic route exchange using BGP between your Azure virtual network and network virtual appliances (NVAs) or on-premises networks. It provides a centralized and scalable solution for route management, allowing seamless integration of routing updates without manual configuration changes.

NEW QUESTION # 39

Which statement about deploying VMs in a gateway subnet is true?

- A. VMs are automatically deployed in a gateway subnet
- B. VMs can be deployed in a gateway subnet only after you deploy the VPN Gateway
- C. VMs are required in a gateway subnet
- **D. VMs are not allowed in a gateway subnet**

Answer: D

Explanation:

Azure does not allow the deployment of virtual machines (VMs) in a gateway subnet. The gateway subnet is specifically reserved for Azure VPN Gateway or ExpressRoute Gateway instances, and deploying other resources in it can cause gateway deployment or operation failures.
