Google Associate Cloud Engineer Exam Sample Questions (Q183-Q188):

NEW QUESTION # 183

You have an object in a Cloud Storage bucket that you want to share with an external company. The object contains sensitive data. You want access to the content to be removed after four hours. The external company does not have a Google account to which you can grant specific user-based access privileges. You want to use the most secure method that requires the fewest steps. What should you do?

- A. Create a new Cloud Storage bucket specifically for the external company to access. Copy the object to that bucket. Delete the bucket after four hours have passed.
- **B. Create a signed URL with a four-hour expiration and share the URL with the company.**
- C. Configure the storage bucket as a static website and furnish the object's URL to the company. Delete the object from the storage bucket after four hours.
- D. Set object access to 'public' and use object lifecycle management to remove the object after four hours.

Answer: B

Explanation:

Explanation

Signed URLs are used to give time-limited resource access to anyone in possession of the URL, regardless of whether they have a Google account. <https://cloud.google.com/storage/docs/access-control/signed-urls>

NEW QUESTION # 184

Your company has a large quantity of unstructured data in different file formats. You want to perform ETL transformations on the data. You need to make the data accessible on Google Cloud so it can be processed by a Dataflow job. What should you do?

- A. Upload the data into Cloud SQL using the import function in the console.
- B. Upload the data to Cloud Storage using the gsutil command line tool.
- **C. Upload the data to BigQuery using the bq command line tool.**
- D. Upload the data into Cloud Spanner using the import function in the console.

Answer: C

NEW QUESTION # 185

You have a project using BigQuery. You want to list all BigQuery jobs for that project. You want to set this project as the default for the bq command-line tool. What should you do?

- A. Use "bq generate config-url" to generate a URL to the Google Cloud Platform Console to set the default project.
- B. Use "bq config set project" to set the default project.
- **C. Use "gcloud config set project" to set the default project.**
- D. Use "gcloud generate config-url" to generate a URL to the Google Cloud Platform Console to set the default project.

Answer: C

Explanation:

A is correct because you need to use gcloud to manage the config/defaults.

B is not correct because the bq command-line tool assumes the gcloud configuration settings and can't be set through BigQuery.

C is not correct because entering this command will not achieve the desired result and will generate an error.

D is not correct because entering this command will not achieve the desired result and will generate an error.

NEW QUESTION # 186

You need to update a deployment in Deployment Manager without any resource downtime in the deployment. Which command

should you use?

- A. gcloud deployment-manager resources update --config <deployment-config-path>
- **B. gcloud deployment-manager deployments update --config <deployment-config-path>**
- C. gcloud deployment-manager resources create --config <deployment-config-path>
- D. gcloud deployment-manager deployments create --config <deployment-config-path>

Answer: B

NEW QUESTION # 187

Your Dataproc cluster runs in a single Virtual Private Cloud (VPC) network in a single subnet with range 172.16.20.128/25. There are no private IP addresses available in the VPC network. You want to add new VMs to communicate with your cluster using the minimum number of steps. What should you do?

- A. Create a new VPC network for the VMs with a subnet of 172.32.0.0/16. Enable VPC network Peering between the Dataproc VPC network and the VMs VPC network. Configure a custom Route exchange.
- B. Modify the existing subnet range to 172.16.20.0/24.
- C. Create a new Secondary IP Range in the VPC and configure the VMs to use that range.
- **D. Create a new VPC network for the VMs. Enable VPC Peering between the VMs' VPC network and the Dataproc cluster VPC network.**

Answer: D

Explanation:

Explanation

A subnet has a single primary IP address range and, optionally, one or more secondary IP address ranges. For each subnet IP address range, Google Cloud creates a subnet route. When you use VPC Network Peering, Google Cloud always exchanges the subnet routes that don't use privately reused public IP addresses between the two peered networks. If firewall rules in each network permit communication, VM instances in one network can communicate with instances in the peered network.
