## Certification Analytics-Arch-201 Exam Infor & Analytics-Arch-201 Flexible Learning Mode

Actual4Labs is a leading provider of top-quality Salesforce Certified Tableau Architect (Analytics-Arch-201) preparation material for the Analytics-Arch-201 test. Our Salesforce Certified Tableau Architect (Analytics-Arch-201) exam questions are designed to help customers get success on the first try. These latest Salesforce Analytics-Arch-201 Questions are the result of extensive research by a team of professionals with years of experience.

## Salesforce Certified Tableau Architect Sample Questions (Q164-Q169):

### NEW QUESTION # 164

In configuring Connected App authentication for Tableau Server, what is a key step to ensure se-cure and proper functionality of the integration?

- A. Allocating additional storage on Tableau Server for data accessed by the connected app
- **B. Registering the connected app in Tableau Server and obtaining client credentials (client ID and secret)**
- C. Setting up a dedicated VPN channel between Tableau Server and the connected app
- D. Creating a unique user account in Tableau Server for each user of the connected app

**Answer: B**

Explanation:

Registering the connected app in Tableau Server and obtaining client credentials (client ID and secret) Registering the connected app in Tableau Server and obtaining client credentials is essential for secure integration. These credentials are used to authenticate the app with Tableau Server, ensuring that only authorized apps can access data and resources, and maintaining se-cure communication between the app and the server. Option A is incorrect because creating a unique user account for each app user is not necessary for Connected App authentication, which is based on app-level credentials. Option C is incorrect as allocating additional storage on Tableau Server is not directly related to the configuration of Connected App authentication. Option D is incorrect because setting up a VPN is not a standard requirement for configuring Connected App authentication.

#### NEW QUESTION # 165

When implementing SSL encryption in Tableau Server, what is a critical step to ensure secure communication between the server and clients?

- A. Enabling SSL on client devices that access Tableau Server
- **B. Obtaining and installing a valid SSL certificate from a trusted certificate authority on Tableau Server**
- C. Configuring Tableau Server to use a specific set of encryption algorithms
- D. Setting up a dedicated SSL decryption server to handle incoming SSL traffic

**Answer: B**

Explanation:

Obtaining and installing a valid SSL certificate from a trusted certificate authority on Tableau Server Obtaining and installing a valid SSL certificate from a trusted certificate authority is a crucial step in implementing SSL encryption in Tableau Server. This certificate is used to establish a secure communication channel between the server and clients, ensuring that data transmitted is encrypted and protected from interception or tampering. Option A is incorrect because while configuring encryption algorithms is part of SSL configuration, obtaining and installing a valid SSL certificate is the primary and most critical step. Option C is incorrect as setting up a dedicated SSL decryption server is not a standard practice for SSL implementation in Tableau Server. Option D is incorrect because enabling SSL on client devices, while important for overall security, is not directly related to the implementation of SSL on Tableau Server.

#### NEW QUESTION # 166

A company is migrating its Tableau Server environment from an older version to a newer version on a different server. What is the most crucial step to ensure a successful migration?

- A. Migrating all content and data without testing in the new environment
- B. Focusing only on the migration of user accounts, disregarding data and content
- C. Upgrading the old server to the newest version before migrating to a different server
- **D. Conducting a comprehensive compatibility check and testing of dashboards and data sources in the new environment**

**Answer: D**

Explanation:

Conducting a comprehensive compatibility check and testing of dashboards and data sources in the new environment Ensuring compatibility and conducting thorough testing in the new environment are essential to prevent issues with dashboard functionality and data integrity after the migration. Option A is incorrect because migrating without prior testing can lead to unexpected issues in the new environment. Option C is incorrect as focusing solely on user accounts neglects the critical aspects of data and dashboard migration. Option D is incorrect because upgrading the old server first is not necessary and might introduce additional complexity.

#### NEW QUESTION # 167

A multinational company is implementing Tableau Cloud and requires a secure method to manage user access across different regions, adhering to various data privacy regulations. What is the most appropriate authentication strategy?

- A. Universal access with a single shared login for all users
- B. Randomized password generation for each user session
- C. Region-specific local authentication for each group of users
- **D. Integration with a centralized identity management system that complies with regional data privacy laws**

**Answer: D**

Explanation:

Integration with a centralized identity management system that complies with regional data privacy laws This strategy ensures secure and compliant user access management across different regions by leveraging a centralized system that is designed to meet various data privacy regulations. Option A is incorrect because a single shared login lacks security and does not comply with regional data privacy laws. Option B is incorrect as region-specific local authentication can lead to fragmented and inconsistent access control. Option D is incorrect because randomized password generation for each session, while secure, is impractical and user-unfriendly.

### NEW QUESTION # 168

In troubleshooting Mutual SSL authentication issues on Tableau Server, what is a common area to investigate?

- A. The compatibility of SSL certificates with different web browsers
- B. The network bandwidth between the client and the Tableau Server
- C. The version of Tableau Server in relation to the SSL protocol version
- **D. The expiration dates of the SSL certificates on both the client and server**

**Answer: D**

Explanation:

The expiration dates of the SSL certificates on both the client and server A common issue in Mutual SSL authentication is the expiration of SSL certificates. Checking the expiration dates of the certificates on both the client and server sides is crucial, as expired certificates will prevent successful authentication. Regular monitoring and timely renewal of certificates are key to maintaining uninterrupted Mutual SSL connections. Option A is incorrect because while browser compatibility is important, it is not a common cause of Mutual SSL issues. Option C is incorrect as network bandwidth, while important for overall connectivity, does not directly impact Mutual SSL authentication. Option D is incorrect because the version of Tableau Server is generally not related to specific SSL protocol versions for Mutual SSL authentication.

### NEW QUESTION # 169

.....

You can contact our service any time as long as you have questions on our Analytics-Arch-201 practice engine. They are available 24-hours for guidance and information to help you solve your problem or confusion on the Analytics-Arch-201 exam braindumps. And they can also give you the fast and professional help as they are trained to deal with matters with high-efficiency on our Analytics-Arch-201 learning guide. And if you buy our Analytics-Arch-201 training materials, you will find you can have it in 5 to 10 minutes.
