CompTIA Server+ Certification Exam Sample Questions (Q445-Q450):

NEW QUESTION # 445

Due to a recent application migration, a company's current storage solution does not meet the necessary requirements for hosting data without impacting performance when the data is accessed in real time by multiple users. Which of the following is the BEST solution for this Issue?

- A. Deploy a new Fibre Channel SAN solution
- B. Install local external hard drives for affected users.
- C. Compress the data to increase available space.
- D. Add extra memory to the server where data is stored.

Answer: A

Explanation:

A Fibre Channel SAN solution is a type of storage area network (SAN) that uses high-speed optical fiber cables to connect servers and storage devices. A SAN allows for hosting data without impacting performance when the data is accessed in real time by multiple users, as it provides fast data transfer rates, low latency, high availability, and scalability¹². A local external hard drive (A) would not be suitable for multiple users, as it would limit the accessibility and security of the data. Adding extra memory to the server (B) would not solve the problem of data access performance, as it would not increase the bandwidth or reduce the congestion of the network. Compressing the data would not improve the performance either, as it would add extra overhead and complexity to the data processing and retrieval. NEW QUESTION # 446

An administrator needs to increase the size of an existing RAID 6 array that is running out of available space. Which of the following is the best way the administrator can perform this task?

- A. Expand the array by changing the RAID level to 6.
- B. Replace all the array drives at once and then expand the array.
- C. Expand the array by changing the RAID level to 10.
- D. Replace the array drives one at a time and then expand the array.

Answer: D

Explanation:

RAID 6 is a type of RAID that uses block-level striping with two parity blocks distributed across all member disks. It allows for two disk failures within the RAID set before any data is lost¹. A minimum of four disks is required to create RAID 6¹. To increase the size of an existing RAID 6 array, the administrator can replace the array drives one at a time with larger drives and then expand the array. This way, the data and parity are rebuilt on each new drive and the array remains operational during the process².

NEW QUESTION # 447

A server administrator wants to check the open ports on a server. Which of the following commands should the administrator use to complete the task?

- A. netstat -a
- B. telnet
- C. nbtstat
- D. nslookup

Answer: A

Explanation:

netstat is a command-line tool that displays network connections, routing tables, interface statistics, and more. The -a option shows all listening and non-listening sockets on the server. This can help check the open ports on a server and identify any unwanted or malicious connections. NEW QUESTION # 448

A technician is installing a large number of servers in a data center with limited rack space. Which of the following would accomplish this goal while using the least amount of space?

- A. Blade enclosure
- B. Rack balancing
- C. Rail kits
- D. Rack mount

Answer: A

Explanation:

Comprehensive and Detailed Explanation:

Blade enclosures are designed to maximize server density by housing multiple blade servers within a single chassis. This design minimizes the physical footprint compared to traditional rack-mounted servers. Key benefits include:

* Space Efficiency: Multiple servers share power, cooling, and networking within a compact enclosure.

- * Simplified Management: Centralized management of power, cooling, and networking simplifies administration.
- * Scalability: Easily add or replace blade servers without significant reconfiguration.

NEW QUESTION # 449

A server administrator is taking advantage of all the available bandwidth of the four NICs on the server. Which of the following NIC-teaming technologies should the server administrator utilize?

- A. Load balancing
- B. Fault tolerance
- C. Fail over
- D. **Link aggregation**

Answer: D

Explanation:

Explanation

Link aggregation is a technique that combines multiple physical network links into one logical link with higher bandwidth and redundancy. It can take advantage of all the available bandwidth of the NICs (Network Interface Cards) on the server and provide load balancing and failover capabilities for network traffic.
