Reliable Mule-Dev-301 Test Pattern Latest Questions Pool Only at ITdumpsfree

ITdumpsfree is a reliable study center providing you the valid and correct Mule-Dev-301 questions & answers for boosting up your success in the actual test. Mule-Dev-301 PDF file is the common version which many candidates often choose. If you are tired with the screen for study, you can print the Mule-Dev-301 Pdf Dumps into papers. With the pdf papers, you can write and make notes as you like, which is very convenient for memory. We can ensure you pass with Mule-Dev-301 study torrent at first time.

Salesforce Certified MuleSoft Developer II Sample Questions (Q36-Q41):

NEW QUESTION # 36

A developer has created the first version of an API designed for business partners to work commodity prices. What should developer do to allow more than one major version of the same API to be exposed by the implementation?

- A. In Design Center, open the RAML and modify baseUri to include a variable that indicates the version number
- B. In Anypoint Studio, generate scaffolding from the RAML, and then modify the flow names generated by APIKit to include

- a variable with the major version number
- C. In Anypoint Studio, generate scaffolding from the RAML, and then modify the `<http:listener>` in the generated flows to include a parameter to replace the version number
- D. In Design Center, open the RAML and modify each operation to include the major version number

Answer: A

Explanation:

To allow more than one major version of the same API to be exposed by the implementation, the developer should modify the `baseUri` property in the RAML file to include a variable that indicates the version number. The `baseUri` property defines the base URL of the API and can include variables that are replaced with actual values when mocking or deploying the API. By using a variable for the version number, the developer can expose different versions of the API using different base URLs and avoid conflicts or confusion. Reference: <https://docs.mulesoft.com/api-designer/design-modify-raml-specs#baseuri>
<https://docs.mulesoft.com/api-manager/2.x/api-versioning>

NEW QUESTION # 37

Refer to the exhibits.

Bioinfo System API is implemented and published to Anypoint Exchange. A developer wants to invoke this API using its REST Connector.

What should be added to the POM?

- A.
- B.
- C.
- D.
- E.

Answer: A

Explanation:

To invoke Bioinfo System API using its REST Connector, option E should be added to the `pom.xml` file. This option adds a dependency for Bioinfo System API REST Connector with its group ID, artifact ID, version, classifier, and type. The classifier specifies that it is a REST Connector (`raml-client`), and the type specifies that it is a Mule plugin (`mule-plugin`). Reference: <https://docs.mulesoft.com/apikit/4.x/apikit-4-generate-from-rest-api-task#add-the-api-dependency-to-the-pom-file>

NEW QUESTION # 38

Which statement is true when working with correlation IDs?

- A. The HTTP Listener regenerates correlation IDs regardless of the HTTP request
- B. The Anypoint MQ Connector automatically propagates correlation IDs
- C. The VM Connector does not automatically propagate correlation IDs
- D. The HTTP Listener generates correlation IDs unless a correlation ID is received in the HTTP request

Answer: D

Explanation:

When working with correlation IDs, the HTTP Listener generates correlation IDs unless a correlation ID is received in the HTTP request. In that case, it propagates the received correlation ID throughout the flow execution. Correlation IDs are used to track events across different flows or applications. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/about-mule-message#message-attributes>

NEW QUESTION # 39

A scatter-gather router is configured with four routes: Route A, B, C and D. Route C fails.

- A. `Payload.failures['2']`
- B. `Error,errorMessage,payload.results ['2']`
- C. `Error,errorMessage,payload.failures['2']`

- D. Payload ['2']

Answer: B

Explanation:

The result of accessing route C failure is `Error.errorMessage.payload.failures['2']`. This is because a scatter-gather router returns an aggregated message that contains an array of results from each route and an array of failures from each route. The failures array contains error objects with information about each failed route execution. To access route C failure, which is the third route (index 2), the developer needs to use `Error.errorMessage.payload.failures['2']` expression. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-reference#scatter-gather-output>

NEW QUESTION # 40

Which statement is true when using XML SDK for creating custom message processors?

- A. An XML SDK provides both inbound and outbound operations
- B. Operations can be reused in recursive calls
- C. All operations are public
- **D. Properties are fields defined by an end user of the XML SDK component and serve as a global configuration for the entire Mule project in which they are used**

Answer: D

Explanation:

When using XML SDK for creating custom message processors, all operations are public by default and can be used by any Mule application that imports them. There is no way to make an operation private or protected in XML SDK. Reference: <https://docs.mulesoft.com/mule-sdk/1.1/xml-sdk#operations>

NEW QUESTION # 41

.....

It is the right time to think about your professional career. The right path is to enroll in Salesforce Certified MuleSoft Developer II Mule-Dev-301 certification and start preparation with the assistance of Salesforce Mule-Dev-301 PDF dumps and practice test software. The Salesforce Mule-Dev-301 PDF Questions file and practice test software both are ready to download. Just pay an affordable Salesforce Mule-Dev-301 exam dumps charge and download files and software.
