**Free CTFL\_Syll\_4.0 Exam, CTFL\_Syll\_4.0 Questions Exam**

If you want to improve yourself and make progress, if you are not satisfied with your present job, if you are still staying up for the CTFL\_Syll\_4.0 exam day and night, please use our CTFL\_Syll\_4.0 study materials. For with the high pass rate as 98% to 100%, we are confident to claim that our high quality and high efficiency of our CTFL\_Syll\_4.0 Exam Torrent is unparalleled in the market. We provide the latest and exact CTFL\_Syll\_4.0 exam quiz to our customers and you will be grateful if you choose our exam torrent and gain what you are expecting in the shortest time.

## ISQI ISTQB Certified Tester Foundation Level (CTFL) v4.0 Sample Questions (Q126-Q131):

### NEW QUESTION # 126

After being in operation for many years, a document management system must be decommissioned as it has reached its end of life. This system will not be replaced by any other new system. A legal obligation provides that all documents within the system must be kept for at least 20 years in a state archive.

Which of the following statements about maintenance testing for decommissioning of this system is true?

- A. No maintenance testing is required as this system will not be replaced
- B. Regression testing is required as part of maintenance testing
- **C. Data migration testing is required as part of maintenance testing**
- D. Confirmation testing is required as part of maintenance testing

**Answer: C**

Explanation:

When a document management system is decommissioned, maintenance testing must include data migration testing to ensure that all documents are correctly transferred to a state archive, meeting legal requirements for long-term storage. This process verifies that data integrity is maintained during migration.

### NEW QUESTION # 127

Which ONE of the following statements does NOT describe how testing contributes to higher quality?

- A. Software testing identifies defects, which can be used to improve development activities.
- **B. The testing of software demonstrates the absence of defects.**
- C. Properly designed tests that pass reduce the level of risk in a system.
- D. Performing a review of the requirement specifications before implementing the system can enhance quality.

**Answer: B**

Explanation:

\* The testing of software does not demonstrate the absence of defects, but rather the presence of defects or the conformance of the software to the specified requirements<sup>1</sup>. Testing can never prove that the software is defect-free, as it is impossible to test all possible scenarios, inputs, outputs, and behaviors of the software<sup>2</sup>. Testing can only provide a level of confidence in the quality of the software, based on the coverage, effectiveness, and efficiency of the testing activities<sup>3</sup>.

\* The other options are correct because:

\* A. Properly designed tests that pass reduce the level of risk in a system, as they verify that the system meets the expected quality attributes and satisfies the needs and expectations of the users and clients<sup>4</sup>. Risk is the potential for loss or harm due to the occurrence of an undesirable event<sup>5</sup>. Testing can help to identify, analyze, prioritize, and mitigate the risks associated with the software product and project<sup>6</sup>.

\* C. Software testing identifies defects, which can be used to improve development activities, as they provide feedback on the quality of the software and the effectiveness of the development processes<sup>7</sup>. Defects are flaws or errors in the software that cause it to deviate from the expected or required results or behavior. Testing can help to detect, report, track, and resolve the defects, and prevent them from recurring in the future.

\* D. Performing a review of the requirement specifications before implementing the system can enhance quality, as it can ensure that the requirements are clear, complete, consistent, testable, and aligned with the needs and expectations of the users and clients. Requirements are the specifications of what the software should do and how it should do it. Testing can help to validate that the requirements are met by the software, and verify that the software is implemented according to the requirements.

## NEW QUESTION # 128

Which of the following statements about statement coverage is true?

- A. Achieving 100% statement coverage ensures that 100% branch coverage is achieved
- **B. Achieving 80% statement coverage ensures that 80% of all executable statements within the code have been exercised**
- C. Achieving 90% statement coverage ensures that 90% branch coverage is achieved
- D. Achieving 100% statement coverage ensures that no variable within the code has been used without being initialized

**Answer: B**

Explanation:

Statement coverage, also known as line coverage, is a metric used in white-box testing to measure the percentage of executable statements in the source code that have been executed by the test suite. Achieving a certain percentage of statement coverage means that an equivalent percentage of the executable statements in the code have been executed during testing.

For example, achieving 80% statement coverage indicates that 80% of the lines of code have been run through during the testing process. This metric helps in identifying parts of the code that have not been tested and may contain undetected defects.

It's important to note that achieving high statement coverage does not necessarily guarantee that all possible paths or scenarios within the code are tested, nor does it ensure the detection of all types of defects. Other coverage metrics, such as branch coverage or condition coverage, might also be necessary to achieve a more thorough testing process.

References:

- \* The official ISTQB CTFL syllabus clearly defines statement coverage and explains that it ensures that the corresponding percentage of all executable statements have been tested.

## NEW QUESTION # 129

You are working on creating test cases for a user story -

As a customer, I want to be able to book an ISTQB exam for a particular date, so that I can find choose my time slot and pay the correct amount, including discounts, if any.

The acceptance criteria for this :

1. The dates shown should be from the current date to 2 years in future
2. Initially there should be 10 timeslots available for each day, 1 hour each, starting at 8 AM GMT
3. Maximum 5 persons should be able to select a time slot after which that time slot should become unavailable
4. First timeslot should have a 10% discount.

Which of the following is the BEST example of a test case for this user story?

- A. Logon to the site. Expected result: Default 8 AM (GMT) timeslot should be selected. Change the time to any other timeslot. Expected result: New slot should be booked
- B. Logon to the site. Book an exam for the current date. Expected result: timeslots should be shown. Change the time to any other date prior to the selected date. Expected result: New slot should become visible.
- C. Logon to the site. Book 5 exams for the current date. Expected result: Exams should be booked. Book 6th timeslot for the same date. Expected result: The exam should be booked but no discount should be given.
- **D. Logon to the site and book an exam for the 8 AM (GMT) timeslot. Expected result: You should get 10% discounted price. Change the time to any other timeslot. Expected result: Discount should be removed**

**Answer: D**

Explanation:

The best example of a test case for this user story should cover the acceptance criteria comprehensively.

Option A addresses the critical aspects of the acceptance criteria:

\* Verifying the discount for the first timeslot (8 AM GMT) - ensuring it provides a 10% discount.  
\* Verifying that changing the time slot removes the discount - ensuring the discount logic is correctly applied.  
This test case effectively validates the functionality related to both the discount and the ability to change time slots, which are key parts of the user story's requirements.

### NEW QUESTION # 130

As a result of the joint evaluation of a product version with the customer, it has been concluded that it would be appropriate to retrieve an earlier version of the product and carry out a benchmark. Depending on the result, further development will be carried out based on the current version or the retrieved version.

Which mechanism, process, and/or technique will allow the specific version (including the testing work products) of a given software product to be restored?

- A. Configuration management
- B. Risk management
- C. Change management
- D. Defect management

#### Answer: A

Explanation:

Configuration management (B) ensures that versions of software and test artifacts are properly tracked, stored, and retrievable. It allows teams to:

- \* Restore earlier versions of software and test work products
- \* Maintain traceability between requirements, tests, and code
- \* Avoid discrepancies due to mismanaged versions
- \* (A) is incorrect because defect management tracks issues but does not restore versions.
- \* (C) is incorrect because change management controls changes but does not track past versions.
- \* (D) is incorrect because risk management assesses risks but does not manage software versions.

Effective configuration management ensures the ability to roll back changes and maintain system stability.
