ISTQB Certified Tester Advanced Level - Test Manager Sample Questions (Q81-Q86):

NEW QUESTION # 81
When scheduling performance testing, which of the following approaches would be most advisable? [1]

- A. Requiring all performance tests to pass before starting functional testing
- B. Deferring the start of performance testing until all functional defects have been resolved
- C. Leveraging end users to do unit-level performance testing and automated tools for system-level performance testing
- D. Starting the performance testing during unit and integration testing

Answer: D

Explanation:
Performance testing is the process of determining the speed, responsiveness, and stability of a system under a given workload1. Performance testing should be started as early as possible in the software development lifecycle, preferably during unit and integration testing, to identify and resolve performance issues before they become costly or risky2. Starting performance testing early can also help to validate the performance requirements, design, and architecture of the system, as well as to optimize the performance testing strategy and scope3. Therefore, option A is the correct answer. Option B is incorrect because deferring the start of performance testing until all functional defects have been resolved can delay the detection and resolution of performance issues, increase the cost and effort of performance testing, and reduce the confidence and quality of the system4. Option C is incorrect because leveraging end users to do unit-level performance testing and automated tools for system-level performance testing can introduce inconsistency, bias, and inefficiency in the performance testing process, as well as compromise the reliability and validity of the performance test results. Option D is incorrect because requiring all performance tests to pass before starting functional testing can create unrealistic or unnecessary expectations, as well as hinder the progress and feedback of the functional testing activities. NEW QUESTION # 83
Which of the following metrics would be most beneficial to collect to determine the effectiveness of a review process? [2]

- A. The elapsed time between each module's review and its corresponding deployment into production

- B. The development language used to create each module that was reviewed
- C. The business criticality of each module that was reviewed
- D. The number of defects found in production for each module that was reviewed

Answer: D

Explanation:
The effectiveness of a review process can be measured by how well it detects and removes defects from the work products being reviewed1. One of the metrics that can indicate the defect detection capability of a review process is the number of defects found in production for each module that was reviewed2. This metric can show how many defects escaped the review process and were not detected until the software was deployed. A lower number of defects found in production means a higher review effectiveness. Therefore, option A is the correct answer. Option B is incorrect because the development language used to create each module that was reviewed is not relevant to the review process effectiveness. Option C is incorrect because the elapsed time between each module's review and its corresponding deployment into production is not a measure of defect detection or removal, but rather a measure of development speed or efficiency. Option D is incorrect because the business criticality of each module that was reviewed is not a measure of defect detection or removal, but rather a measure of risk or priority.
