Salesforce Certified Platform Data Architect Sample Questions (Q188-Q193):

NEW QUESTION # 188

Universal Containers (UC) is expecting to have nearly 5 million shipment records in its Salesforce org. Each shipment record has up to 10 child shipment item records. The Shipment custom object has an Organization-wide Default (OWD) sharing model set to Private and the Shipment Item custom object has a Master-Detail relationship to Shipment. There are 25 sharing rules set on the Shipment custom object, which allow shipment records to be shared to each of UC's 25 business areas around the globe. These

sharing rules use public groups, one for each business area plus a number of groups for management and support roles. UC has a high turnover of Sales Reps and often needs to move Sales Reps between business areas in order to meet local demand. What feature would ensure that performance, when moving Sales Reps between regions, remains adequate while meeting existing requirements?

- **A. Contact Salesforce to enable Defer Sharing Rules**
- B. Contact Salesforce to create Skinny tables on Shipment.
- C. Configure shipment OWD to Public Read/Write.
- D. Implement data archiving for old Shipment records.

Answer: A

Explanation:

Contacting Salesforce to enable Defer Sharing Rules is the feature that would ensure that performance, when moving Sales Reps between regions, remains adequate while meeting existing requirements. Defer Sharing Rules allows you to defer sharing rule recalculation when you make changes to public groups or roles that are used in sharing rules. This can improve performance and avoid locking issues when you move users between groups or roles.

Implementing data archiving for old Shipment records will not help with the performance issue related to sharing rules. Contacting Salesforce to create Skinny tables on Shipment will not help with the performance issue related to sharing rules. Configuring shipment OWD to Public Read/Write will not meet the existing requirements of having a Private sharing model.

NEW QUESTION # 189

Universal Containers has a large number of Opportunity fields (100) that they want to track field history on. Which two actions should an architect perform in order to meet this requirement?

Choose 2 answer

- **A. Create a custom object to store the previous and new field values.**
- B. Use Analytic Snapshots to store a copy of the record when changed.
- **C. Create a custom object to store a copy of the record when changed.**
- D. Select the 100 fields in the Opportunity Set History Tracking page.

Answer: A,C

Explanation:

Creating a custom object to store a copy of the record when changed and creating a custom object to store the previous and new field values are two possible actions that an architect can perform to meet the requirement of tracking field history on 100 Opportunity fields. A custom object can store more fields and records than the standard field history tracking feature, which has a limit of 20 fields per object and 18 or 24 months of data retention. A custom object can also be used for reporting and analysis of field history data. The other options are not feasible or effective for meeting the requirement.

NEW QUESTION # 190

NTO would like to retrieve their SF orgs meta data programmatically for backup within a various external. Which API is the best fit for accomplishing this task?

- **A. Metadata API**
- B. SOAP API
- C. Bulk API in serial mode
- D. Tooling API

Answer: A

Explanation:

The best API for retrieving Salesforce org metadata programmatically is the Metadata API. The Metadata API provides access to the metadata that defines the structure and configuration of an org, such as custom objects, fields, workflows, security settings, etc. It also supports deploying, retrieving, creating, updating, and deleting metadata components. The Metadata API can be used with various tools, such as Ant, Workbench, or IDEs.

NEW QUESTION # 191

(NTO) has multiple salesforce orgs based on geographical reports (AMER, EMEA, APAC). NTO products are in the AMER org and need to be created in the EMEA and APAC after the products are approved. Which two features should a data architect recommend to share records between salesforce orgs? Choose 2

- A. Salesforce 2 Salesforce
- B. Federation search
- C. Change data capture (CDC)
- D. Salesforce connect.

Answer: A,C

Explanation:

The two features that a data architect should recommend to share records between Salesforce orgs are:

Change Data Capture (CDC): This is a feature that publishes change events for changes in Salesforce records, such as create, update, delete, and undelete operations. Change events can be subscribed by external systems or other Salesforce orgs using various tools, such as Platform Events, Streaming API, or CometD. CDC can help keep data in sync between Salesforce orgs in near real time.

Salesforce to Salesforce (S2S): This is a feature that allows sharing records and related data with other Salesforce orgs that you partner with. You can choose which records and fields to share, and which orgs to share with. You can also accept updates from the other orgs to keep the data consistent.

Salesforce Connect is not a good feature to share records between Salesforce orgs because it is intended for integrating external data sources with Salesforce using external objects. Federation Search is not a good feature to share records between Salesforce orgs because it is intended for searching across multiple Salesforce orgs without sharing data.

NEW QUESTION # 192

Ursa Major Solar's legacy system has a quarterly accounts receivable report that compiles data from the following:

- Accounts
- Contacts
- Opportunities
- Orders
- Order Line Items

Which issue will an architect have when implemented this in Salesforce?

- A. Salesforce does NOT allow more than four objects in a single report type.
- B. A report CANNOT contain data from Accounts and Contacts.
- C. Custom report types CANNOT contain Opportunity data.
- D. Salesforce does NOT support Orders or Order Line Items.

Answer: A

Explanation:

The issue that an architect will have when implementing the quarterly accounts receivable report in Salesforce is that Salesforce does not allow more than four objects in a single report type. A report type defines the set of records and fields available to a report based on the relationships between a primary object and up to four related objects. A report type has the following limitations: It cannot include more than four objects in a single report type, which means that the report cannot compile data from five objects (Accounts, Contacts, Opportunities, Orders, and Order Line Items) at once.

It cannot include objects that are more than two relationships away from each other, which means that the report cannot access fields from Order Line Items through Opportunities and Orders.

It cannot include objects that have a many-to-many relationship with each other, which means that the report cannot access fields from Contacts and Opportunities through the junction object Opportunity Contact Role.

NEW QUESTION # 193

.....

Our services before, during and after the clients use our Plat-Arch-201 study materials are considerate. Before the purchase, the clients can download and try out our Plat-Arch-201 study materials freely. During the clients use our products they can contact our online customer service staff to consult the problems about our products. After the clients use our Plat-Arch-201 Study Materials if they can't pass the test smoothly they can contact us to require us to refund them in full and if only they provide the failure proof we will refund them at once. Our company gives priority to the satisfaction degree of the clients and puts the quality of the service in the

first place.
