Having a Adobe Certification AD0-E716 Exam certificate can help people who are looking for a job get better employment opportunities in the IT field and will also pave the way for a successful IT career for them.

Adobe Commerce Developer with Cloud Add-on Sample Questions (Q15-

Q20):

NEW QUESTION # 15

An Adobe Commerce developer added a new API method to search and retrieve a list of Posts for a custom Blog functionality. This is the content of the module's etc/webapi.xml file:

```
<?xml version="1.0" ?>
<routes xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="urn:magento:module:Magento_Webapi:etc/webapi.xsd">
  <route url="/V1/myvendor-blog/post/search" method="GET">
    <service class="MyVendor\Blog\Api\PostRepositoryInterface" method="getList"/>
    <resources>
      <resource ref="MyVendor_Blog:Post_view"/>
    </resources>
  </route>
</routes>
```

The new code has been deployed to production and the merchant is using <https://merchant.domain.com/swagger> to review the new endpoint, but it is not visible in swagger. What would be a reason for this?

- A. The webapi.xml file should be moved into the etc/webapi_rest/webapi.xml file.
- B. The getrum annotation is missing in the MyVendor\Blog\Api\PostRepositoryInterface class.
- C. Since the new endpoint is not anonymous, the merchant needs to enter a valid integration token in swagger in order to see the new method.

Answer: C

Explanation:

The reason why the new endpoint is not visible in swagger is that since the new endpoint is not anonymous, the merchant needs to enter a valid integration token in swagger in order to see the new method. The webapi.xml file specifies that the resource for the new endpoint is MyVendor_Blog:post, which means that only authorized users with this permission can access it. To generate an integration token, the merchant needs to create an integration in the admin panel and activate it. Then they can copy the token and paste it in swagger's authorization field. NEW QUESTION # 16

An Adobe Commerce developer is creating a module (Vendor.ModuleName) to be sold on the Marketplace.

The new module creates a database table using declarative schema and now the developer needs to make sure the table is removed when the module is disabled.

What must the developer do to accomplish this?

- A. There is nothing further the developer needs to do. The table will be removed when the when bin/magento module:uninstall vendor_ModuleName is run.
- B. Add a schema patch that implements Magento\Framework\Setup\Patch\PatchRevertableInterface and drops the table in the revert function.
- C. There is nothing further the developer needs to do. The table will be removed when the module is disabled and bin/magento setup:upgrade is run.

Answer: B

Explanation:

According to the Declarative Schema Overview guide for Magento 2 developers, declarative schema is a new feature that allows developers to declare the final desired state of the database and has the system adjust to it automatically, without performing redundant operations. However, declarative schema does not support uninstalling modules or reverting changes. To remove a table when a module is disabled, the developer needs to add a schema patch that implements Magento\Framework\Setup\Patch\PatchRevertableInterface and drops the table in the revert function. The revert function will be executed when the module is disabled using bin/magento module:disable command. NEW QUESTION # 17

A message queue currently has queue/consumer-wait-for-messages set to true, which allows the consumer process to run until a message is inserted into the queue. A piece of functionality is driven by data stored in the model \Magento\variable\Model\variable and this value is only loaded once during the consumer run. If the variable is updated we want the

consumer to restart so that the new value is loaded into memory without having to reload the variable on each message consumed. The Adobe Commerce developer has created an after plugin on the `\Magento\Variable\Model\variable::save()` function. How would the developer use the plugin to trigger the consumer restart?

- A. Call the function `\Magento\Framework\MessageQueue\PoisonPill\PoisonPillPutInterface::put()`.
- **B. Call the function `\Magento\Framework\MessageQueue\Consumers\TriggerRestartInterface::trigger()`.**
- C. Set the global Cache key `trigger_consumer_restart` to 1.

Answer: B

Explanation:

The developer can use the plugin to trigger the consumer restart by calling the function

`\Magento\Framework\MessageQueue\Consumers\TriggerRestartInterface::trigger()`. This function will write a flag to the cache storage that will be checked by the consumer process. If the flag is set, the consumer process will terminate itself and restart with the updated configuration. Verified References: [Magento 2.4 DevDocs] 1

NEW QUESTION # 18

A developer wants to deploy a new release to the Adobe Commerce Cloud Staging environment, but first they need the latest code from Production.

What would the developer do to update the Staging environment?

- A. 1. Checkout to Production environment
2. Use the `magento-cloud synchronize <environment-ID> Commerce CLI Command`
- **B. 1. Log in to the Project Web Interface.
2. Choose the Staging environment, and click Sync**
- C. 1. Log in to the Project Web Interface.
2. Choose the Staging environment, and click Merge

Answer: B

NEW QUESTION # 19

An Adobe Commerce developer is tasked with adding a new export option for the order grid, they have added the following code for the export button within `sales_order_grid.xml`:

```
<exportButton>
  <settings>
    <options>
      <option name="txt" xsi:type="array">
        <item name="value" xsi:type="string">txt</item>
        <item name="label" xsi:type="string" translate="true">TXT</item>
        <item name="url" xsi:type="string">vendor_module/sales/export/customExport</item>
      </option>
    </options>
  </settings>
</exportButton>
```

Upon testing, they are getting redirected, what would be a cause for this error?

- **A. The developer has to add a formkey for the new export option.**
- B. The layout cache needs to be refreshed.
- C. The option's uri attribute is not valid.

Answer: A

Explanation:

The developer has to add a formkey for the new export option because the formkey is required for security reasons. Without the formkey, the request will be rejected and redirected to the dashboard page. Verified Reference: [Magento 2.4 User Guide] [Magento 2.4 DevDocs]
