2026 Adobe AD0-E724: Unparalleled Pass4sure Commerce Developer Professional Study Materials

In today's society, our pressure grows as the industry recovers and competition for the best talents increases. By this way the AD0-E724 exam is playing an increasingly important role to assess candidates. Considered many of our customers are too busy to study, the AD0-E724 real study dumps designed by our company were according to the real exam content, which would help you cope with the AD0-E724 Exam with great ease. With about ten years' research and development we still keep updating our AD0-E724 prep guide, in order to grasp knowledge points in accordance with the exam, thus your study process would targeted and efficient.

Adobe Commerce Developer Professional Sample Questions (Q126-Q131):

NEW QUESTION # 126

How would a developer add a sensitive environment-specific configuration value on an Adobe Commerce Cloud project?

- A. Use the Cloud CLI for Commerce command Mgento-cloud configset to add the configuration

- B. Add sensitive Environment-specific variable in the Project Web Interface.
- C. Connect to the server using SSH and add the configuration in the app/etc/config.php file.

Answer: B

Explanation:

To add a sensitive environment-specific configuration value on an Adobe Commerce Cloud project, the developer should use the Project Web Interface. This interface allows for the secure entry of sensitive data, which is then encrypted and stored securely. This method ensures that sensitive information is not exposed in the codebase or version control.

NEW QUESTION # 127

Which action, if any, should be taken to forbid Adobe Commerce Admin from performing specific actions?

- A. Create a new user role with custom-defined resources, and assign it to the admin user
- B. This action cannot be taken since all admin users must have full access.
- C. Enable custom roles in the store configuration, and assign admin user ID(s).

Answer: A

Explanation:

To forbid Adobe Commerce Admin from performing specific actions, a developer should create a new user role with custom-defined resources, and assign it to the admin user. This can be done by going to System > Permissions > Roles and creating a new role. In the Resources section, the developer can select the specific resources that they want to restrict the admin user from accessing. To restrict specific actions within the Adobe Commerce Admin, the recommended approach is to utilize Magento's Access Control List (ACL). This can be done by creating a new user role with custom-defined resources and assigning this role to the admin user. This approach allows for granular control over what actions an admin user can perform by specifying allowed resources within the role. Magento's ACL system is designed to manage permissions effectively, ensuring that users only have access to the necessary functionalities required for their role.

NEW QUESTION # 128

An Adobe Commerce developer successfully added a new column to the customers grid. This column needs the data to be formatted before showing its content in the grid.

According to best practices, how would the developer add the custom logic to render the column?

- A. 1. Override the Magento\Customer\Ui\Component\DataProvider Class using a preference.
2. Override the getData() method and add the custom logic per row.
- B. 1. Create a custom class extending \Magento\Ui\Component\Listing\Columns\Column.
2. Add the custom logic within the prepareDataSource method.
3. Add an attribute class to the column node within the module's customer_listing.xml.
- C. 1. Create an after plugin for Magento\Ui\Component\Listing\Columns\Column::prepareColumn().
2. Add the custom logic within the afterPrepareColumn method.

Answer: B

Explanation:

The best practice to add custom logic for data formatting in a grid column is to create a new class extending \Magento\Ui\Component\Listing\Columns\Column. The prepareDataSource method is designed for processing and formatting data before it is displayed in the UI component.

* Using prepareDataSource in a Custom Column Class:

* By extending \Magento\Ui\Component\Listing\Columns\Column, you gain access to the prepareDataSource method, where you can manipulate data as needed.

* Adding a custom class allows for reusability and modular code, which is in line with Magento's architecture.

* Why Option B is Correct:

* This option uses Magento's UI component structure properly, focusing on the intended class and method for grid data manipulation. Option A involves an unnecessary plugin, and Option C with DataProvider preference is generally discouraged for simple UI modifications.

* Implementation Steps:

* Extend the Column class and add your logic in the prepareDataSource method.

* Then, in your customer_listing.xml, reference this class within the <column> node using the class attribute.

NEW QUESTION # 129

An Adobe Commerce developer is being tasked with creating a new cron job to run a method that has already been written. What are the minimally required steps to accomplish this?

- A. Create a crontab.xmi file and set a schedule for the new cron job.
- B. Create crontab.xmi and cron_groups.xmi files to assign the new job to a cron group.
- C. Create a crontab.xmi file and a new system configuration in system.xmi for the schedule.

Answer: A

Explanation:

According to the Configure and run cron guide for Magento 2 developers, the crontab.xmi file is used to declare and configure cron jobs for a module. The file should specify the name, instance, method and schedule of the cron job. Therefore, creating a crontab.xmi file and setting a schedule for the new cron job are the minimally required steps to accomplish this task. Verified References:<https://devdocs.magento.com/guides/v2.3/config-guide/cli/config-cli-subcommands-cron.html>

To set up a new cron job in Adobe Commerce, you need to define it in the crontab.xml file. This file is essential to schedule cron tasks and is all that's required for simple cron job configurations. You specify the cron job schedule, method, and class in this file. Here's a minimal example of crontab.xml:

```
<?xml version="1.0"?>
<config
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:noNamespaceSchemaLocation="urn:
  magento:module:Magento_Cron/etc/crontab.xsd"
>
<group id="default">
<job name="your_custom_cron_job" instance="Vendor\Module\Cron\YourJob" method="execute">
<schedule>0 * * * *</schedule> <!-- Runs every hour -->
</job>
</group>
</config>
```

* group id: This specifies the cron group; "default" is commonly used, but you can define custom groups in cron_groups.xml if necessary.

* job: Defines the cron job, with name, instance (path to the class), and method attributes.

* schedule: Uses standard cron expressions to specify the frequency.

Additional Resources:

* Adobe Commerce Developer Guide: Cron Jobs

* Magento 2 Crontab XML Configuration

NEW QUESTION # 130

A developer is working on a task that includes a custom controller creation. A controller should forward the request to a different action.

How can the developer complete this task?

- A. Return the forward object with action as an argument in the object's forward method
- B. Specify the forward action in the controllerforward.xml configuration file.
- C. Implement a forwardToAction method in the controller, and return the action where the request should be forwarded.

Answer: A

Explanation:

To forward the request to a different action, the developer can use the following code in the controller:

```
return $resultForward->forward('action');
```

where \$resultForward is an instance of \Magento\Framework\Controller\Result\ForwardInterface and 'action' is the name of the action where the request should be forwarded.

There is no controllerforward.xml configuration file or forwardToAction method in Adobe Commerce.

Verified References: [Adobe Commerce Developer Guide - Forward action result] In Magento, to forward a request from one controller action to another, a developer can utilize the forward method available in the controller action class. This is achieved by returning a result from the action method that instructs Magento to forward the request to another action. The forward object is obtained by calling the

\$this->resultForwardFactory->create() method within the controller action. Then, the target action is specified by calling theforwardmethod on this object with the action name as the argument, such as \$resultForward->forward('targetAction'). This approach is consistent with Magento's emphasis on using result objects to control the flow of request processing within its MVC architecture.

NEW QUESTION # 131

.....

Our product is revised and updated according to the change of the syllabus and the latest development situation in the theory and the practice. The AD0-E724 exam torrent is compiled elaborately by the experienced professionals and of high quality. The contents of AD0-E724 guide questions are easy to master and simplify the important information. It conveys more important information with less answers and questions, thus the learning is easy and efficient. The language is easy to be understood makes any learners have no obstacles. The AD0-E724 Test Torrent is suitable for anybody no matter he or she is in-service staff or the student, the novice or the experience people who have worked for years. The software boosts varied self-learning and self-assessment functions to check the results of the learning.
