New Soft AD0-E724 Simulations | AD0-E724 Reliable Dumps Ebook

If you buy and use the AD0-E724 study materials from our company, you can complete the practice tests in a timed environment, receive grades and review test answers via video tutorials. You just need to download the software version of our AD0-E724 Study Materials after you buy our study materials. You will have the right to start to try to simulate the real examination. We believe that the AD0-E724 study materials from our company will not let you down.

Adobe Commerce Developer Professional Sample Questions (Q92-Q97):

NEW QUESTION # 92

Which file is used to add a custom router class to the list of routers?

- A. config.xml
- B. routes.xml
- C. di.xml

Answer: B

Explanation:

To add a custom router class to the list of routers in Magento, the `routes.xml` file is used. This file should be located in the `etc` directory of the module, under the appropriate area (either `frontend` or `adminhtml`). Within the `routes.xml` file, you define a router with an ID, a route with an ID and `frontName`, and specify the module that the route corresponds to. This setup allows Magento to recognize and utilize the custom router when processing URLs, directing requests to the appropriate controllers based on the custom routing logic defined.

NEW QUESTION # 93

Which CLI command should be used to determine that static content signing is enabled?

- A. `bin/magento config:show dev/static/sign`
- B. `bin/magento config:show dev/static/status`
- C. `bin/magento config:show dev/static/sign/status`

Answer: A

Explanation:

After a thorough search of the provided documents, I couldn't find a direct reference to the specific CLI command for determining if static content signing is enabled in Magento. However, the typical command for checking configuration settings in Magento is `bin/magento config:show <path>`, where `<path>` is the configuration path for the setting you wish to view. Based on Magento's configuration path patterns and the options provided, the most logical choice would be `bin/magento config:show dev/static/sign`, although this cannot be confirmed without further context or documentation.

NEW QUESTION # 94

Which two actions will the developer need to take to translate strings added in JS files? (Choose two.)

- A. `translate('<string>');`
- B. `define ([
'jquery',
'mage/translate'
], function ($, $t) {.`
- C. `$ trans(,<string>')`
- D. `$.mage._('<string>');`

Answer: A,B

Explanation:

To translate strings added in JavaScript files in Adobe Commerce, developers need to use the `mage/translate` RequireJS module along with the `$.mage._('<string>')` function to mark strings for translation. This approach ensures that any text strings embedded within JavaScript code can be localized according to the store's current locale, providing a consistent and accessible user experience across different languages and regions. The `mage/translate` module and the `$.mage._()` function work together to retrieve the corresponding translated strings from Magento's translation dictionaries, dynamically replacing the original text in the JavaScript code with the appropriate translations.

NEW QUESTION # 95

An integration named `Marketing` is created on the Adobe Commerce instance. The integration has access on `Magento_Customer::` customer resources and the access token is `xxxxxx`.

How would the rest API be called to search the customers?

- A. Passing integration name and access token as http auth credentials:
`curl -X GET https://Marketing:XXXXXXX($magentourl/rest/V1/customers/search?searchCriteria . . .`
Using integration name as username and access token as password, get the admin token (yyyyyy) via:
`curl -X POST https://magentourl/rest/V1/integration/admin/token -d '{"username":"Marketing",
"password":"XXXXXX"}' -H 'Content-`
- B. Type: `application/json`
Use the admin token as Bearer

```
curl -X GET https://magentourl/rest/V1/customers/search?searchCriteria... -H 'Authorization: Bearer YYYYYYY'
```

- **C. Using the integration access token as Bearer:**

```
curl -X GET https://magentourl/rest/V1/customers/search?searchCriteria... -H 'Authorization: Bearer XXXXXXX'
```

Answer: C

Explanation:

When using an integration token to access Magento's REST API, you can authenticate requests by including the token in the Authorization header as a Bearer token. This allows the system to recognize the permissions assigned to the integration and grant access to the specified resources.

* Using the Access Token as Bearer Token:

* In Magento, integration tokens are treated as Bearer tokens for API authentication. Once the token is generated, you can directly use it in the Authorization header.

* The access token XXXXXXX will provide access to resources allowed by the Magento_Customer::customer permission.

* Why Option A is Correct:

* Option A shows the correct way to authenticate an API call using a pre-existing integration token by setting the header Authorization: Bearer XXXXXXX. This is a straightforward way to search for customers without additional steps.

* Options B and C describe methods that are not necessary for this scenario. The access token already has the necessary permissions, so there's no need to re-authenticate or obtain an admin token.

* Example Command:

```
curl -X GET "https://magentourl/rest/V1/customers/search?searchCriteria[filterGroups][0][filters][0][field]=email&searchCriteria[filterGroups][0][filters][0][value]=example@example.com" -H "Authorization: Bearer XXXXXXX"
```

NEW QUESTION # 96

On an Adobe Commerce Cloud platform, what type of environment will be provisioned when launching the CLI for Commerce command `magento-cloud environment:branch <environment-name> <parent-environment-id>`?

- A. An integration environment with fresh Adobe Commerce Cloud installation.
- **B. An integration environment with the code and database from the parent environment.**
- C. An empty integration environment without any code or database.

Answer: B

Explanation:

The type of environment that will be provisioned when launching the CLI for Commerce command `magento-cloud environment:branch <environment-name> <parent-environment-id>` is an integration environment with the code and database from the parent environment. Integration environments are temporary environments that are used for testing and development purposes on the Adobe Commerce Cloud platform. They can be created from any branch of code and have their own dedicated database and services. When creating an integration environment using the CLI for Commerce command, the code and database from the parent environment are copied to the new integration environment, creating an exact replica of the parent environment.
