AP-202 Dumps Torrent - Latest AP-202 Dumps Sheet

If you are the first time to buy the AP-202 learning material online, or you have bought them for many times, there may be some problem that puzzle you, if you have any questions about the AP-202 exam dumps, you can ask our service stuff for help. They have the professional knowledge of AP-202 Training Materials, and they will be very helpful for solving your problem. In addition, we have free demo for you to try before buying the product, and you can have a try before purchasing.

Salesforce B2B Commerce for Developers Accredited Professional Sample Questions (Q69-Q74):

NEW QUESTION # 69

In what way can a developer's code subscribe to platform events?

- A. Apex Triggers
- B. Flows

- C. Flows and Apex Triggers
- D. Process Builder, Apex Triggers and Flows

Answer: C

Explanation:

In Salesforce, developers can subscribe to platform events using both Flows and Apex Triggers. This allows for the execution of automated processes in response to the events. Apex Triggers can be written to respond to event messages in the same way they respond to DML events. Similarly, Flows can be configured to trigger upon the receipt of a platform event. This functionality is documented in Salesforce's developer guides and best practices, which emphasize the versatility and power of combining declarative and programmatic approaches to respond to platform events.

NEW QUESTION # 70

Which two are considered discrete units of work (code units) within a transaction in the debug logs?

- A. Apex class
- B. Web service invocation
- C. Validation rule
- D. Lightning component load

Answer: A,B

Explanation:

Two data types that are considered discrete units of work (code units) within a transaction in the debug logs are web service invocation and Apex class. A discrete unit of work (code unit) is a segment of executable code that runs as part of a transaction in Salesforce. A transaction is a sequence of operations that are treated as a single unit of work and are executed under certain isolation and consistency rules. A transaction can consist of one or more discrete units of work (code units) that are executed sequentially or concurrently depending on various factors such as triggers, asynchronous calls, or limits. A debug log is a record of database operations, system processes, and errors that occur when executing a transaction or running unit tests in Salesforce. A debug log can capture information about each discrete unit of work (code unit) within a transaction, such as its start time, end time, duration, events, variables, and limits. A web service invocation is a type of discrete unit of work (code unit) that involves calling an external web service from Apex code using SOAP or REST protocols. A web service invocation can be synchronous or asynchronous depending on the method used to make the callout. A web service invocation can be captured in a debug log with its details and results. An Apex class is another type of discrete unit of work (code unit) that involves executing Apex code that defines a class with properties and methods. An Apex class can be invoked from various sources such as triggers, Visualforce pages, Lightning components, or API calls. An Apex class can be captured in a debug log with its details and results. A validation rule is not a type of discrete unit of work (code unit) within a transaction in the debug logs, as it is not a segment of executable code but rather a formula expression that defines a business rule for a field or object. A validation rule can be evaluated during a transaction and cause an error if the rule condition is not met, but it cannot be captured as a separate code unit in a debug log. A Lightning component load is not a type of discrete unit of work (code unit) within a transaction in the debug logs either, as it is not a segment of executable code but rather an event that occurs when a Lightning component is rendered on a web page or application. A Lightning component load can be measured by various performance tools such as Lightning Inspector or Lighthouse, but it cannot be captured as a separate code unit in a debug log. Salesforce [Salesforce Developer Blog: Transactions and Request Processing], [Salesforce Help: Debug Logs], [Salesforce Developer Guide: Invoking Callouts Using Apex], [Salesforce Developer Guide: Apex Classes], [Salesforce Help: Validation Rules], [Salesforce Developer Blog: Measuring Lightning Component Performance]

NEW QUESTION # 71

In a B2B Commerce store, which three tasks must a developer complete to implement the use of a third-party service for either tax, shipping, or pricing calculation?

- A. Create an Apex class with an invocable method
- B. Create an Apex class implementing the appropriate interface.
- C. Register an Apex class as the integration in the store administration
- D. Create a flow to call the external service directly
- E. Create a named credential for authentication with an external service

Answer: B,C,E

Explanation:

To implement the use of a third-party service for either tax, shipping, or pricing calculation in a B2B Commerce store, a developer must complete these three tasks:

Create an Apex class that implements the appropriate interface for the calculation type. For example, for tax calculation, the developer must implement the `sfdc_checkout.CartTax` interface and define the `getTax` method. This method takes a `Cart` object as an input parameter and returns a list of `CartTax` objects with the calculated tax amounts.

Create a named credential for authentication with the external service. A named credential specifies the URL of a callout endpoint and its required authentication parameters. The developer can use the named credential in the Apex class to make the callout to the external service and handle the response.

Register the Apex class as the integration in the store administration. The developer must specify the Apex class name in the corresponding field for the calculation type. For example, for tax calculation, the developer must enter the Apex class name in the Tax Calculation Integration field. This way, the store can invoke the Apex class to perform the calculation for each cart.

The other options are not valid tasks for implementing the use of a third-party service. Creating a flow to call the external service directly is not supported for B2B Commerce, and creating an Apex class with an invocable method is not required for the calculation integration. Reference:

Integrate with External Services

CartTax Interface

Named Credentials

[Store Administration]

NEW QUESTION # 72

A user wants to have a Contact Us page in the storefront. This page will be a web-to-lead form and it should have the header and footer, essentially the same look and feel as all the pages in the application. How can this requirement be fulfilled?

- A. Page Include
- B. Body Include Begin
- C. Subscriber Template
- D. Subscriber Page (CC Page)

Answer: D

Explanation:

To have a Contact Us page in the storefront that is a web-to-lead form and has the same look and feel as all the pages in the application, the requirement can be fulfilled by creating a Subscriber Page (CC Page). This is a custom Visualforce page that can be added to the storefront and use the standard header and footer components. The page can also include a web-to-lead form that submits data to Salesforce as leads. Salesforce B2B Commerce and D2C Commerce Developer Guide, Subscriber Pages

NEW QUESTION # 73

Which handlebars helper expression is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup?

- A. `{{#ifSetting 'Page.cfg'}} ... {{/ifSetting}}`
- B. `{{#ifStoreSetting 'Field_c'}} ... {{/ifStoreSetting}}`
- C. `{{#ifDisplay 'Page.cfg'}} ... {{/ifDisplay}}`
- D. `{{#ifConfig 'Field_c'}} ... {{/ifConfig}}`

Answer: D

Explanation:

The handlebars helper expression that is used in Salesforce B2B Commerce pages and components to toggle the display of a block of markup is `{{#ifConfig 'Field_c'}} ... {{/ifConfig}}`. This expression will evaluate the value of the configuration setting with the API name `Field_c` and render the block of markup if the value is true, or skip it if the value is false. For example, `{{#ifConfig 'CO.showMiniCart'}} <div id="mini-cart"> ... </div> {{/ifConfig}}` will render the mini-cart div only if the configuration setting `CO.showMiniCart` is true. Salesforce B2B Commerce and D2C Commerce Developer Guide, Handlebars Helpers

NEW QUESTION # 74

.....

To improve the B2B Commerce for Developers Accredited Professional (AP-202) exam questions, Exam4Docs always upgrades and updates its AP-202 dumps PDF format and it also makes changes according to the syllabus of the B2B Commerce for Developers Accredited Professional (AP-202) exam. In the Web-Based Salesforce AP-202 Practice Exam, the B2B Commerce for Developers Accredited Professional (AP-202) exam dumps given are actual and according to the syllabus of the test. This B2B Commerce for Developers Accredited Professional (AP-202) practice exam is compatible with all operating systems.
