- A. ACL
- B. IPS
- C. WAF
- D. OLP

Answer: D

- **C. Refactor**
- D. Rearchitect

Answer: C

NEW QUESTION # 80

A developer at a small startup company deployed some code for a new feature to its public repository. A few days later, a data breach occurred. A security team investigated the incident and found that the database was hacked. Which of the following is the most likely cause of this breach?

- A. Unpatched web servers
- B. Compromised deployment agent
- C. Database core dump
- **D. Hard-coded credentials**

Answer: D

Hard-coded credentials within code, especially when deployed in a public repository, are a common security vulnerability. This is a likely cause of the data breach in the scenario described.
