그 외, Itexamdump F5CAB4 시험 문제집 일부가 지금은 무료입니다: <https://drive.google.com/open?id=15o-m6d1bVXw7Cv0DRLZMu4MbRKvMIopF>

아무런 노력을 하지 않고 승진이나 연봉인상을 꿈꾸고 있는 분이라면 이 글을 검색해낼수 없었을것입니다. 승진이나 연봉인상을 꿈꾸면 승진과 연봉인상을 시켜주는 회사에 능력을 과시해야 합니다. IT인증시험은 국제적으로 승인해주는 자격증을 취득하는 시험입니다. Itexamdump의F5인증 F5CAB4덤프의 도움으로 F5인증 F5CAB4시험을 패스하여 자격증을 취득하면 승진이나 연봉인상의 꿈이 이루어집니다. 결코 꿈은 이루어질것입니다.

F5 F5CAB4 시험요강:

주제	소개
주제 1	• Apply procedural concepts required to manage the state of a high availability pair: This domain covers controlling and monitoring failover states in high availability pairs, including forcing standby • offline modes, reporting failover status, and verifying device trust.
주제 2	• Identify management connectivity configurations: This section focuses on understanding management access configurations, including management IP addresses, port lockdown settings, remote connectivity verification, and troubleshooting access issues.

주제 3	• Explain authentication methods: This section focuses on user management including creating • modifying users, configuring remote authentication providers, and implementing group-based access control.
주제 4	• Apply procedural concepts required to create, manage, and restore a UCS archive: This domain covers UCS backup and restore procedures, understanding backup use cases, proper storage practices, and UCS file contents including private keys.
주제 5	• Explain config sync: This section focuses on configuration synchronization procedures, identifying sync errors, determining sync necessity, checking sync status, and comparing configuration timestamps.
주제 6	• Given a scenario, interpret Service status: This section teaches interpreting service states, analyzing netstat output, and determining whether services are listening on specific ports.
주제 7	• List which log files could be used to find events and • or hardware issues: This section teaches identification of key log files (• var • log • ltm, secure, audit), understanding event severity levels, and interpreting log messages.

도비 F5 F5CAB4 시험

F5 인증 F5CAB4시험에 도전해보려고 결정하셨다면 Itexamdump덤프공부가이드를추천해드립니다. Itexamdump덤프는 고객님의게서 필요한것이 무엇인지 너무나도 잘 알고 있습니다. Itexamdump의 F5 인증 F5CAB4덤프는F5 인증 F5CAB4시험을 쉽게 만듭니다.

최신 F5-CA F5CAB4 무료샘플문제 (Q62-Q67):

질문 # 62

The BIG-IP system is provisioned for LTM only. The BIG-IP Administrator is tasked with provisioning ASM. What process restarts when the BIG-IP Administrator changes the module provisioning? (Choose one answer)

- A. httpd
- B. sshd
- C. tmm
- D. bd

정답: C

설명:

When a BIG-IP Administrator changes module provisioning (for example, enabling ASM on a system previously provisioned only for LTM), the BIG-IP system must restart the Traffic Management Microkernel (TMM) process.

The TMM process is responsible for:

- * Traffic handling
- * LTM, ASM, and other traffic-processing modules
- * Enforcing security and application policies

Provisioning changes affect how traffic modules are loaded and integrated into TMM. As a result, TMM is restarted, which causes a temporary interruption of traffic processing. This is expected behavior and is why module provisioning changes should be planned during a maintenance window.

Why the other options are incorrect:

- * A. bd is related to blade/platform management, not module provisioning.
- * C. sshd handles SSH access and is not affected by provisioning changes.
- * D. httpd supports the Configuration Utility (GUI) and does not restart due to module provisioning.

Therefore, the correct answer is B. tmm.

질문 # 63

Users report that traffic is negatively affected every time a BIG-IP device fails over. The traffic becomes stabilized after a few minutes. What should the BIG-IP Administrator do to reduce the impact of future failovers?

- A. Enable Failover Multicast Configuration
- B. Configure a global SNAT Listener
- **C. Configure MAC Masquerade**
- D. Set up Failover Method to HA Order

정답: C

설명:

Comprehensive and Detailed Explanation From BIG-IP Administration Control Plane Administration documents: When a failover occurs, the newly active device must inform the surrounding network that it now "owns" the shared IP addresses. Without MAC Masquerade, the new device uses its own hardware MAC, requiring upstream routers to update their ARP tables (which causes a delay). MAC Masquerading allows the HA pair to share a "floating" MAC address, ensuring the Control Plane transition is transparent to the network layer

질문 # 64

Which TMSH command initiates a manual configuration synchronization to the specified device group?
(Choose one answer)

- A. tmsh run sys device-group update-config
- B. tmsh modify sys failover auto-sync enable
- **C. tmsh run cm config-sync to-group <device_group>**
- D. tmsh load sys config to-group <device_group>

정답: C

설명:

In a BIG-IP Device Service Cluster (DSC), manual configuration synchronization is performed using the ConfigSync framework. The supported and documented command to manually push the local configuration to a specific device group is:

tmsh run cm config-sync to-group <device_group>

This command:

- * Initiates a one-time manual ConfigSync
 - * Pushes the local device's configuration to all members of the specified device group
 - * Is commonly used when auto-sync is disabled or when the administrator wants explicit control over synchronization timing Why the other options are incorrect:
 - * A is not a valid TMSH command for ConfigSync.
 - * B enables auto-sync but does not perform an immediate synchronization.
 - * D is not a valid or supported TMSH command for device group configuration synchronization.
- Therefore, the correct command to manually synchronize configuration to a device group is C.

질문 # 65

A BIG-IP Administrator is unable to connect to the management interface via HTTPS. What is a possible reason for this issue?

- A. The IP address of the device used to access the management interface is NOT included in the "P Allow" list in the Configuration Utility.
- B. An incorrect management route is specified.
- **C. The IP address of the device used to access the management interface is NOT included in the "httpd Allow" list in the CLI.**
- D. The port lockdown setting is configured to Allow None.

정답: C

설명:

Comprehensive and Detailed Explanation From BIG-IP Administration Control Plane Administration documents: Management connectivity is protected by an allowed access list for the httpd daemon. Unlike TMM data ports which use 'Port Lockdown' settings, the management port's access is controlled by a specific 'Allow' list. If an administrator's IP is not explicitly included in this list, the Control Plane will reject HTTPS connection attempts to the management utility.

질문 # 66

What is the tmsh command to list the IP ranges that can access the management interface via SSH?
(Choose one answer)

- A. tmsh list /sys sshd allow
- B. tmsh show /sys sshd /etc/hosts.allow
- C. tmsh list /sys sshd /etc/hosts.allow
- D. tmsh show /sys sshd allow

정답: A

설명:

On BIG-IP systems, SSH access restrictions are configured under the `/sys sshd` object. The `allow` property defines the IP addresses or networks permitted to connect to the management interface using SSH.

* The list command is used to display the current configuration settings.

* Therefore, `tmsh list /sys sshd allow` correctly displays the configured allowed IP ranges.

Why the other options are incorrect:

* A (show) displays runtime or statistical information, not configuration values.

* C and D incorrectly reference /etc/hosts.allow; BIG-IP manages SSH access through TMSH objects, not by directly listing host files in this context.

질문 # 67
