Trustworthy C_SEC_2405 Practice, C_SEC_2405 Test Discount

Our C_SEC_2405 training materials are designed to help users consolidate what they have learned, will add to the instant of many training, the user can test their learning effect in time after finished the part of the learning content, have a special set of wrong topics in our C_SEC_2405 guide torrent, enable users to find their weak spot of knowledge in this function, iterate through constant practice, finally reach a high success rate. As a result, our C_SEC_2405 study questions are designed to form a complete set of the contents of practice can let users master knowledge to pass the C_SEC_2405 exam.

SAP Certified Associate - Security Administrator Sample Questions (Q51-Q56):

NEW QUESTION # 51
What happens to data within SAP Enterprise Threat Detection during the aggregation process? Note: There are 3 correct answers to this question.

- A. It is normalized.
- B. It is prioritized.

- C. It is pseudonymized.
- D. It is categorized.
- E. It is enriched.

Answer: A,C,E

Explanation:
During the aggregation process in SAP Enterprise Threat Detection, data undergoes several transformations to enhance security analysis. It is pseudonymized, replacing sensitive identifiers (e.g., user IDs) with pseudonyms to protect privacy while maintaining data utility for threat detection. Data is normalized, converting heterogeneous data formats from various sources into a standardized structure, ensuring consistency for analysis across systems. Additionally, data is enriched by adding contextual information, such as system metadata or threat intelligence, to improve the accuracy of threat identification. These processes enable SAP Enterprise Threat Detection to efficiently analyze large volumes of data while safeguarding sensitive information. Prioritization is not part of aggregation, as it relates to post-analysis actions, and categorization occurs during analysis, not aggregation. By pseudonymizing, normalizing, and enriching data, SAP Enterprise Threat Detection ensures robust threat detection capabilities, supporting real-time monitoring and compliance with data protection regulations in SAP environments.

NEW QUESTION # 52
In the SAP BTP Cockpit, at which level is Trust Configuration available? Note: There are 2 correct answers to this question.

- A. Organization
- B. Directory
- C. Subaccount
- D. Global Account

Answer: C,D

NEW QUESTION # 53
Which cybersecurity type does NOT focus on protecting connected devices?

- A. lot security
- B. Application security
- C. Cloud security
- D. Network security

Answer: B

NEW QUESTION # 54
Which functions in SAP Access Control can be used to approve or reject a user's continued access to specific security roles? Note: There are 2 correct answers to this question.

- A. SOD Review
- B. User Access Review
- C. Role Certification
- D. Role Reaffirm

Answer: B,D

Explanation:
In SAP Access Control, User Access Review and Role Reaffirm are functions used to approve or reject a user's continued access to specific security roles. User Access Review allows managers or administrators to periodically review and certify user role assignments, ensuring that access remains appropriate for current job functions. This process involves approving or rejecting access based on business needs, supporting compliance with security policies. Role Reaffirm, similarly, requires periodic certification of role assignments, enabling administrators to confirm or revoke user access to specific roles to prevent unauthorized permissions. SOD (Segregation of Duties) Review focuses on identifying conflicts in role assignments, not approving user access, and Role Certification is not a standard term in SAP Access Control, though it may be confused with Role Reaffirm. These functions ensure ongoing governance of access rights, reducing risks and maintaining compliance in SAP systems by ensuring only authorized users retain access to critical roles.

NEW QUESTION # 55

What use cases are available for a Local Identity Directory? Note: There are 3 correct answers to this question.

- A. Merging attributes
- B. Hybrid mode
- C. Classic use case
- D. Proxy mode
- E. S/4HANA use case

Answer: B,C,D

Explanation:

A Local Identity Directory in SAP Cloud Identity Services supports multiple use cases to manage user identities effectively. The Classic use case involves maintaining a standalone identity repository for user authentication and authorization, suitable for scenarios where a single, centralized directory is needed without external integration. The Hybrid mode allows the Local Identity Directory to work alongside other identity providers, enabling a mix of local and external user management, which is ideal for organizations transitioning to cloud environments while retaining on-premise systems. The Proxy mode enables the directory to act as an intermediary, forwarding authentication requests to external identity providers while maintaining local control over user attributes and policies. These use cases provide flexibility for diverse organizational needs. Merging attributes is a function of identity management but not a distinct use case, and S

/4HANA use case is not a specific term for Local Identity Directory configurations. These options ensure that SAP's identity management aligns with varying architectural and security requirements, supporting both cloud and hybrid landscapes.
