## Pass Guaranteed 2026 High Pass-Rate Salesforce OmniStudio-Developer Prep Guide

The OmniStudio-Developer Practice Questions are designed and verified by experienced and renowned Salesforce Certified OmniStudio Developer exam trainers. They work collectively and strive hard to ensure the top quality of Prep4sures OmniStudio-Developer exam practice questions all the time. The OmniStudio-Developer Exam Questions are real, updated, and error-free that helps you in Salesforce Certified OmniStudio Developer exam preparation and boost your confidence to crack the upcoming OmniStudio-Developer exam easily.

Salesforce Certified OmniStudio Developer certification is highly valued by employers because it demonstrates that the candidate has the skills and knowledge needed to develop and implement solutions on the OmniStudio platform. Salesforce Certified OmniStudio Developer certification is also highly valued by clients because it demonstrates that the developer has the expertise needed to develop and implement solutions that meet their specific needs.

## Salesforce Certified OmniStudio Developer Sample Questions (Q32-Q37):

### NEW QUESTION # 32

A developer needs to transform contact data into a JSON array.

Given the input JSON shown above, what are two ways a developer could configure a DATA Raptor transform to achieve the expected output JSON? Choose 2 answers

- A. Set the Input JSON path as List(Contact) and the Output JSON Path as Contact.
- B. Set the Input JSON Path as Contact the out JSON Path as Contact and the output Data type as List.
- C. Use a formula LIST(Contact), and add the output of the formula as the input in the Transform tab.
- D. Set the input JSON Path as Contact and the OutPut JSON Path as List (Contact)

**Answer: B,C**

Explanation:

A DataRaptor Transform can be used to transform data from one format to another, such as JSON, XML, or CSV. The developer can specify the input and output paths for each field in the Transform tab. The developer can also use formulas to manipulate data in the Formula tab. To transform contact data into a JSON array, the developer can use either of these methods:

Use a formula LIST(Contact), and add the output of the formula as the input in the Transform tab. This will create a list of contact objects from the input JSON and output it as a JSON array.

Set the Input JSON Path as Contact, the Output JSON Path as Contact, and the Output Data Type as List. This will output each contact object as an element of a JSON array.

### NEW QUESTION # 33

A developer has an existing DataRaptorLoad that insert Contact records with inputs as LastName and firstName. The DataRaptor works as expected when previewed.

The developer creates an integration Procedure to test the DataRaptor and is using a SetValues element in the Integration Procedure to set the first name and last name for the contact record. The DataRaptor and Integration Procedure are set up as shown in the exhibit below.

When the developer executes the Integration procedure in preview, the following error message displays:

Required fields are missing: [last Name]",

How should the developer address this issue?

- A. The DataRaptor Post Action in the integration procedure should have been executed before the Set Values Action
- B. SetValuesContactDetails should have been added to Additional input of DataRaptor Post Action in Integration Procedure
- C. The Set values Action Keys should include the DataRaptor Post Action element name path, e.g LoadContactDetails, lastname
- D. The valid field names should be added in the Domain object field in the DataRaptor

**Answer: B**

Explanation:

According to the Integration Procedure Actions page, "To pass data from a Set Values action to a DataRaptor action, add the Set Values action name to the Additional Input field of the DataRaptor action."

### NEW QUESTION # 34

Refer to the exhibit below.

What is the reason that the fields fail to display the fetched data?

- A. Lookup Mode is selected in the properties of the Type Ahead Block.
- B. Use Data JSON is Not selected in the properties of the Type Ahead Block.
- C. The typeHead key is not in the correct format.
- D. FirstName, LastName, and BirthDate are not placed inside the Type Ahead Block.

**Answer: B**

Explanation:

The Use Data JSON property must be selected in the properties of the Type Ahead Block in order to display the fetched data in the fields. The Lookup Mode property is used to specify the type of lookup to perform. The FirstName, LastName, and BirthDate fields can be placed inside or outside the Type Ahead Block. The typeHead key is in the correct format.

### NEW QUESTION # 35

A developer needs to retrieve data from an external system that stores policy data. The external system supports REST APIs to access and update the policies. Due to the volume of the policy data and peak hours of hours of business, calls to the REST APIs

sometimes take longer than expected to response.

The developer creates an Integration Procedure to retrieve the policy data for use in an OmniScript.

Given the external system's known performance issues, which configuration should be used to implement the call to the external system?

Choose 2 answers

- A. Configure a Remote action with timeout settings of 120000
- **B. Set the Timeout property on the HTTP Action in the Integration Procedure**
- **C. Check the Chain on Step Check on the HTTP Action in the Integration Procedure**
- D. Check the Chainable checkbox on the integration procedure Action in the OmniScript

**Answer: B,C**

Explanation:

Setting the Timeout property on the HTTP Action in the Integration Procedure allows the developer to specify how long to wait for a response from the external system before timing out. Checking the Chain on Step Check on the HTTP Action in the Integration Procedure allows the developer to chain multiple HTTP Actions together and execute them sequentially. Configuring a Remote action with timeout settings of 120000 is not necessary, as it is already done by default in OmniStudio. Checking the Chainable checkbox on the integration procedure Action in the OmniScript has no effect on calling an external system.

### NEW QUESTION # 36

Refer to the exhibit below.

What is the reason that the fields fail to display the fetched data?

- A. Lookup Mode is selected in the properties of the Type Ahead Block.
- **B. Use Data JSON is Not selected in the properties of the Type Ahead Block.**
- C. The typeHead key is not in the correct format.
- D. FirstName, LastName, and BirthDate are not placed inside the Type Ahead Block.

**Answer: B**

Explanation:

Explanation

The Use Data JSON property must be selected in the properties of the Type Ahead Block in order to display the fetched data in the fields. The Lookup Mode property is used to specify the type of lookup to perform. The FirstName, LastName, and BirthDate fields can be placed inside or outside the Type Ahead Block. The typeHead key is in the correct format.
