We can't forget the advantages and the conveniences that reliable NSE5_FNC_AD-7.6 real dump compiled by our companies bring to us. First, by telling our customers what the key points of learning, and which learning NSE5_FNC_AD-7.6 exam training questions is available, they may save our customers money and time. They guide our customers in finding suitable jobs and other information as well. Secondly, a wide range of practice types and different version of our NSE5_FNC_AD-7.6 Exam Training questions receive technological support through our expert team. Without this support our customers would have to pay much more for practicing. Thirdly, perfect NSE5_FNC_AD-7.6 practice materials like us even provide you the opportunities to own goal, ideal struggle, better work, and create a bright future.

Fortinet NSE 5 - FortiNAC-F 7.6 Administrator Sample Questions (Q50-Q55):

NEW QUESTION # 50

Which agent can receive and display messages from FortiNAC to the end user?

- A. Passive
- B. MDM
- C. Dissolvable
- **D. Persistent**

Answer: D

NEW QUESTION # 51

An administrator wants to control user access to corporate resources by integrating FortiNAC-F with FortiGate using firewall tags defined on FortiNAC-F.

Where would the administrator assign the firewall tag value that will be sent to FortiGate?

- A. RADIUS group attribute
- B. Device profiling rule
- C. Security rule
- **D. Logical network**

Answer: D

Explanation:

In FortiNAC-F, the integration with FortiGate for Security Fabric and Single Sign-On (FSSO) allows the system to communicate the access level of an endpoint directly to the firewall using firewall tags. This eliminates the need for complex VLAN steering in some environments by allowing the FortiGate to apply policies based on these dynamic tags instead of just a physical or virtual network segment.

The actual assignment of the firewall tag value occurs within a Logical Network. In the FortiNAC-F architectural model, a Logical Network acts as a container for "Access Values". When an administrator configures a Logical Network (located under Network > Logical Networks), they define what that network represents--such as "Corporate Access" or "Contractor Limited". Within that definition, they assign the specific Firewall Tag that matches the tag created on the FortiGate. Once a user or host matches a Network Access Policy, FortiNAC-F identifies the associated Logical Network and pushes the defined tag to the FortiGate via the FSSO connector.

It is important to note that while Network Access Policies (and by extension Security Rules) are the logic engines that trigger the assignment, they do not hold the tag value itself. They simply point to a Logical Network, which serves as the central repository for that specific access configuration.

"To assign firewall tags, navigate to Network > Logical Networks. Select the desired logical network and click Edit. Under the Access Value section, select Firewall Tag as the type and enter the tag name exactly as it appears on the FortiGate. When a Network Access Policy matches a host, FortiNAC sends this tag to the FortiGate as an FSSO message."

NEW QUESTION # 52

An organization has FortiNAC-F deployed and is using layer 3 isolation networks across multiple sites with firewalls.

At a minimum, which three protocols must be allowed between the isolation networks and FortiNAC-F? (Choose three.)

- A. DDNS
- **B. DNS**
- **C. HTTP/HTTPS**
- **D. DHCP**
- E. NTP

Answer: B,C,D

Explanation:

DHCP must be allowed so endpoints in the isolation network can obtain an IP address. DNS must be permitted so isolated hosts can resolve the FortiNAC-F hostname or required resources.

HTTP/HTTPS must be allowed to enable redirection and communication with the FortiNAC-F captive portal for registration and authentication.

NEW QUESTION # 53

An administrator wants to use FortiNAC-F to prevent internal engineers from accessing specific websites as defined in web filter categories on FortiGate.

In addition to a security trigger and associated action, which configuration must also be defined on FortiNAC-F?

- A. A compliance policy
- **B. A user/host profile**
- C. A profiling method
- D. A firewall policy

Answer: B

Explanation:

To enforce restrictions based on web filter categories for internal engineers, FortiNAC-F must identify and group those users or their devices. A user/host profile defines the specific users or hosts (such as internal engineers) to which the security trigger and associated action will apply, enabling targeted enforcement.

NEW QUESTION # 54

A user was attempting to register their host through the registration captive portal. After successfully registering, the host remained in the registration VLAN. Which two conditions would cause this behavior? (Choose two.)

- **A. There is another unregistered host on the same port**
- B. The wrong agent s installed.
- C. There is no agent installed on the host.
- **D. The port default VLAN is the same as the Registration VLAN.**

Answer: A,D

Explanation:

The process of moving a host from a Registration VLAN to a Production VLAN (Access VLAN) is a fundamental part of the FortiNAC-F "VLAN steering" workflow. When a host successfully registers via the captive portal, FortiNAC-F evaluates its Network Access Policies to determine the correct VLAN. If the host remains stuck in the Registration VLAN despite a successful registration, it is typically due to port-level restrictions or the presence of other unregistered devices.

The two most common reasons for this behavior as per the documentation are:

The port default VLAN is the same as the Registration VLAN: If the "Default VLAN" field in the switch port's model configuration is set to the same ID as the Registration VLAN, the port will not change state because FortiNAC-F believes it is already in its "normal" or "forced" state.

There is another unregistered host on the same port: FortiNAC-F maintains the security posture of the physical port. If multiple hosts are connected to a single port (e.g., via a hub or unmanaged switch) and at least one host remains "Rogue" (unregistered), FortiNAC-F will generally keep the entire port in the isolation/registration VLAN to prevent the unregistered host from gaining unauthorized access to the production network.
