SPLK-3002 Instant Access, Valid Test SPLK-3002 Fee

After seeing you struggle, TrainingQuiz has come up with an idea to provide you with the actual and updated Splunk SPLK-3002 practice questions so you can pass the SPLK-3002 certification test on the first try and your hard work doesn't go to waste. Updated SPLK-3002 Exam Dumps are essential to pass the Splunk IT Service Intelligence Certified Admin (SPLK-3002) certification exam so you can advance your career in the technology industry and get a job in a good company that pays you well.

Splunk IT Service Intelligence Certified Admin Sample Questions (Q93-Q98):

NEW QUESTION # 93

Which of the following is a recommended best practice for service and glass table design?

- A. Design glass tables first to discover which KPIs are important.
- B. Plan and implement services first, then build detailed glass tables.
- C. Start with base searches, then services, and then glass tables.
- D. Always use the standard icons for glass table widgets to improve portability.

Answer: A

NEW QUESTION # 94

ITSI Saved Search Scheduling is configured to use `realtime_schedule = 0`. Which statement is accurate about this configuration?

- A. If this value is set to 0, the scheduler may skip scheduled execution periods.
- B. If this value is set to 0, the scheduler might skip some execution periods to make sure that the scheduler is executing the searches running over the most recent time range.
- C. If this value is set to 0, the scheduler bases its determination of the next scheduled search execution time on the current time.
- D. If this value is set to 0, the scheduler bases its determination of the next scheduled search on the last search execution time.

Answer: D

Explanation:

ITSI Saved Search Scheduling is a feature that allows you to schedule searches that run periodically to populate the data for your KPIs. You can configure various settings for your scheduled searches, such as the search frequency, the time range, the cron expression, and so on. One of the settings is `realtime_schedule`, which controls the way the scheduler computes the next execution time of a scheduled search. The statement that is accurate about this configuration is:

B) If this value is set to 0, the scheduler bases its determination of the next scheduled search on the last search execution time. This is called continuous scheduling. If set to 0, the scheduler never skips scheduled execution periods. However, the execution of the saved search might fall behind depending on the scheduler's load. Use continuous scheduling whenever you enable the summary index option.

The other statements are not accurate because:

- A) If this value is set to 0, the scheduler bases its determination of the next scheduled search execution time on the current time. This is not true because this is what happens when the value is set to 1, not 0.
- C) If this value is set to 0, the scheduler may skip scheduled execution periods. This is not true because this is what happens when the value is set to 1, not 0.
- D) If this value is set to 0, the scheduler might skip some execution periods to make sure that the scheduler is executing the searches running over the most recent time range. This is not true because this is what happens when the value is set to 1, not 0.

NEW QUESTION # 95

In maintenance mode, which features of KPIs still function?

- A. KPI searches will execute but will be buffered until the maintenance window is over.
- B. KPI calculations and threshold settings can be modified.
- C. New KPIs can be created, but existing KPIs are locked.
- D. KPI searches still run during maintenance mode, but results go to `itsi_maintenance_summary` index.

Answer: A

Explanation:

It's a best practice to schedule maintenance windows with a 15- to 30-minute time buffer before and after you start and stop your maintenance work. This gives the system an opportunity to catch up with the maintenance state and reduces the chances of ITSI generating false positives during maintenance operations.

Reference: <https://docs.splunk.com/Documentation/ITSI/4.10.2/Configure/AboutMW> A is the correct answer because KPI searches still run during maintenance mode, but the results are buffered until the maintenance window is over. This means that no alerts are triggered during maintenance mode, but once it ends, the buffered results are processed and alerts are generated if necessary. You cannot create new KPIs or modify existing KPIs during maintenance mode. References: [Overview of maintenance windows in ITSI]

NEW QUESTION # 96

Which glass table feature can be used to toggle displaying KPI values from more than one service on a single widget?

- A. Service dependencies.
- B. Service templates.
- C. Service swapping.
- D. Ad-hoc search.

Answer: C

Explanation:

Reference:

A glass table is a visualization tool that allows you to monitor the interrelationships and dependencies across your IT and business services. You can add metrics like KPIs, ad hoc searches, and service health scores that update in real time against a background that you design. One of the features of glass tables is service swapping, which enables you to toggle displaying KPI values from more than one service on a single widget. You can use service swapping to compare metrics across different services without creating multiple glass tables or widgets. Reference: Overview of the glass table editor in ITSI, [Configure service swapping on glass tables]

NEW QUESTION # 97

Which of the following applies when configuring time policies for KPI thresholds?

- A. If a person expects a KPI to change significantly through a cycle on a daily basis, don't use it.
- **B. They are great if you expect normal behavior at 1:00 to be different than normal behavior at 5:00**
- C. It is possible for multiple time policies to overlap.
- D. A person can only configure 24 policies, one for each hour of the day.

Answer: B

Explanation:

Time policies are user-defined threshold values to be used at different times of the day or week to account for changing KPI workloads. Time policies accommodate normal variations in usage across your services and improve the accuracy of KPI and service health scores. For example, if your organization's peak activity is during the standard work week, you might create a KPI threshold time policy that accounts for higher levels of usage during work hours, and lower levels of usage during off-hours and weekends. The statement that applies when configuring time policies for KPI thresholds is:

* B. They are great if you expect normal behavior at 1:00 to be different than normal behavior at 5:00.

This is true because time policies allow you to define different threshold values for different time blocks, such as AM/PM, work hours/off hours, weekdays/weekends, and so on. This way, you can account for the expected variations in your KPI data based on the time of day or week.

The other statements do not apply because:

- * A. A person can only configure 24 policies, one for each hour of the day. This is not true because you can configure more than 24 policies using different time block combinations, such as 3 hour block, 2 hour block, 1 hour block, and so on.
- * C. If a person expects a KPI to change significantly through a cycle on a daily basis, don't use it. This is not true because time policies are designed to handle KPIs that change significantly through a cycle on a daily basis, such as web traffic volume or CPU load percent.
- * D. It is possible for multiple time policies to overlap. This is not true because you can only have one active time policy at any given time. When you create a new time policy, the previous time policy is overwritten and cannot be recovered.
