## WGU Scripting and Programming Foundations Exam Sample Questions (Q62-Q67):

### NEW QUESTION # 62

What does a function definition consist of?

- A. An invocation of a function's name
- B. The function's argument values
- **C. The function's name, inputs, outputs, and statements**
- D. A list of all other functions that call the function

**Answer: C**

Explanation:

A function definition is the blueprint for a block of code designed to perform a specific task. Here's what it includes:

- \* Function Name: A unique name to identify and call the function (e.g., calculate\_area).
- \* Inputs (Parameters/Arguments): Values or variables passed into the function when it's called (e.g., width, height).
- \* Outputs (Return Value): The result the function produces after processing (e.g., the calculated area).
- This value may or may not be explicitly returned.
- \* Statements (Function Body): Contains the code that performs the actions and calculations within the function.

### NEW QUESTION # 63

Which expression has a value equal to the rightmost digit of the integer  $q = 7777$ ?

- A.  $q / 10000$
- **B.  $q \% 10$**
- C.  $q \% 10000$
- D.  $10 \% q$

**Answer: B**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To find the rightmost digit of an integer  $q = 7777$ , we need the units digit (i.e., 7). According to foundational programming principles, the modulo operator (%) with 10 isolates the rightmost digit of a number.

- \* Option A: "10 % q."
- \* Compute:  $10 \% 7777 = 10$  (since  $10 \div 7777$  has a remainder of 10).
- \* Result: 10 ≠ 7. Incorrect.
- \* Option B: "q % 10."
- \* Compute:  $7777 \% 10 = 7$  (remainder of  $7777 \div 10$ , isolating the units digit).
- \* Result: 7 = rightmost digit. Correct.
- \* Option C: "q / 10000."
- \* Compute:  $7777 / 10000 = 0.7777$  (floating-point division).
- \* Result: 0.7777 ≠ 7. Incorrect.
- \* Option D: "q % 10000."
- \* Compute:  $7777 \% 10000 = 7777$  (since  $7777 < 10000$ ).
- \* Result: 7777 ≠ 7. Incorrect.

### NEW QUESTION # 64

Which two statement describe advantages to using programming libraries? Choose 2 answers

- A. Using libraries turns procedural code into object-oriented code.
- B. Using a library minimizes copyright issues in coding.
- C. A program that uses libraries is more portable than one that does not
- D. Libraries always make code run faster.
- E. Using a library prevents a programmer from having to code common tasks by hand
- F. The programmer can improve productivity by using libraries.

**Answer: E,F**

Explanation:

Programming libraries offer a collection of pre-written code that developers can use to perform common tasks, which saves time and effort. This is because:

- \* B. Libraries provide pre-coded functions and procedures, which means programmers don't need to write code from scratch for tasks that are common across many programs. This reuse of code enhances efficiency and reduces the potential for errors in coding those tasks.
- \* E. By using libraries, programmers can significantly improve their productivity. Since they are not spending time writing and testing code for tasks that the library already provides, they can focus on the unique aspects of their own projects.

References:

- \* The benefits of using programming libraries are well-documented in software development literature.

For instance, "Code Complete" by Steve McConnell discusses how libraries can improve programmer productivity. Additionally, "The Pragmatic Programmer" by Andrew Hunt and David Thomas emphasizes the importance of reusing code to increase efficiency and reduce errors.

## NEW QUESTION # 65

What is the loop variable update statement in the following code?

- A.  $J = j + 3$
- B.  $J < 24$
- C. Put  $j$  to output
- D. Integer  $j = -1$

**Answer: A**

Explanation:

The loop variable update statement is responsible for changing the loop variable's value after each iteration of the loop, ensuring that the loop progresses and eventually terminates. In the options provided,  $J = j + 3$  is the statement that updates the loop variable  $j$  by adding 3 to its current value. This is a typical update statement found in loops, particularly in 'for' or 'while' loops, where the loop variable needs to be changed systematically to avoid infinite loops.

## NEW QUESTION # 66

A software developer creates a list of all objects and functions that will be used in a board game application and then begins to write the code for each object.

- A. Design and testing
- B. Analysis and implementation
- C. Design and implementation
- D. Analysis and design

**Answer: C**

Explanation:

The process described involves two main phases: first, the developer is designing the application by creating a list of all objects and functions (the design phase), and then they are writing the code for each object (the implementation phase). This aligns with option C, Design and Implementation. Analysis would involve understanding the requirements or problems the software will address, which is not mentioned in the scenario.

Testing is a separate phase that typically occurs after implementation to ensure the code works as intended.
