WGUSecure Software Design (KEO1) Exam Sample Questions (Q13-Q18):

NEW QUESTION # 13
The Chief Information Security Officer (CISO) has recommended contracting with external experts to perform annual reviews of the enterprise's software products, including penetration testing.
Which post-release deliverable is being described?

- A. External Vulnerability Disclosure Response Process
- B. Third-Party Security Review
- C. Security Strategy for Legacy Code
- D. Post-Release Certifications

Answer: B

NEW QUESTION # 14
While performing functional testing of the ordering feature in the new product, a tester noticed that the order object was transmitted to the POST endpoint of the API as a human-readable JSON object.
How should existing security controls be adjusted to prevent this in the future?

- A. Ensure all requests and responses are encrypted
- B. Ensure passwords and private information are not logged
- C. Ensure sensitive transactions can be traced through an audit log
- D. Ensure the contents of authentication cookies are encrypted

Answer: A

Explanation:
Comprehensive and Detailed In-Depth Explanation:
Transmitting data in a human-readable format, such as JSON, over an API can expose sensitive information if the communication channel is not secure. To protect the confidentiality and integrity of the data, it's essential to encrypt all requests and responses between clients and servers.
Implementing encryption, typically through protocols like HTTPS (which utilizes TLS/SSL), ensures that data transmitted over the network is not readable by unauthorized parties. This prevents potential attackers from intercepting and understanding the data, thereby safeguarding sensitive information contained within the API communications.
This practice is a fundamental aspect of secure software development and aligns with the Implementation business function of the OWASP SAMM. Within this function, the Secure Build practice emphasizes the importance of configuring the software to operate securely in its intended environment, which includes enforcing encryption for data in transit.

NEW QUESTION # 15
The software security team is performing security testing on a new software product using a testing tool that scans the running application for known exploit signatures.
Which security testing technique is being used?

- A. Source-code analysis
- B. Properly-based testing
- C. Automated vulnerability scanning
- D. Penetration testing

Answer: C

Explanation:

The security testing technique that involves using a testing tool to scan a running application for known exploit signatures is known as Automated Vulnerability Scanning. This method is part of dynamic analysis, which assesses the software in its running state to identify vulnerabilities that could be exploited by attackers. Automated vulnerability scanning tools are designed to detect and report known vulnerabilities by comparing the behavior and outputs of the application against a database of known exploit signatures1.
