VMware Cloud Foundation 5.2 Administrator Sample Questions (Q108-Q113):

NEW QUESTION # 108
What is the primary purpose of configuring a Virtual Distributed Switch (VDS) in a vSphere environment?

- A. To provide centralized management of network configurations across multiple ESXi hosts.
- B. To manage storage policies for datastores.
- C. To enable VM snapshots across multiple datastores.
- D. To automate the deployment of virtual machines.

Answer: A

Explanation:
A Virtual Distributed Switch (VDS) in a vSphere environment enables centralized management of network configurations across multiple ESXi hosts. It simplifies network administration by allowing the administrator to configure network settings, such as VLANs, port groups, and policies, for multiple hosts at once, ensuring consistency and scalability.

NEW QUESTION # 109
Which tool is most appropriate for analyzing detailed network performance metrics in a vSphere environment?

- A. vSphere CLI
- B. vSphere Client

- C. Aria Operations
- D. vSAN Health Service

Answer: C

Explanation:
Aria Operations (formerly vRealize Operations) is the most appropriate tool for analyzing detailed network performance metrics in a vSphere environment. It provides comprehensive monitoring, analytics, and performance management, including network performance metrics across the vSphere infrastructure.

NEW QUESTION # 110
What is the primary purpose of configuring VM storage policies in a VMware vSphere environment?

- A. To automate the backup of virtual machines.
- B. To configure CPU and memory reservations for VMs.
- C. To manage network traffic between VMs.
- D. To enforce specific storage requirements such as performance, availability, and redundancy.

Answer: D

Explanation:
The primary purpose of configuring VM storage policies in a VMware vSphere environment is to enforce specific storage requirements such as performance, availability, and redundancy. These policies help ensure that virtual machines are placed on datastores that meet the desired service levels and characteristics.

NEW QUESTION # 111
An administrator's passwords for their NSX 'root', 'admin', and 'audit' accounts in the Cloud Foundation management domain expired. The administrator logged into the NSX Manager console and changed the passwords for all three accounts. The passwords are now showing a status of "Disconnected" in the SDDC Manager UI.

- A. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Sync.
- B. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Remediate.
- C. In order to correct this issue, how can SDDC Manager be updated with the new passwords?
- D. In SDDC Manager, navigate to Password Management and select the account with the password with a "Disconnected" status, click the vertical ellipsis (three dots), and click Rotate.

Answer: D

Explanation:
To resolve the issue of disconnected accounts in SDDC Manager after password changes, the administrator must navigate to the Password Management section in the SDDC Manager UI. From there, the administrator can select the affected account, click the vertical ellipsis (three dots), and choose Update to enter the new password for that account, ensuring SDDC Manager is synced with the correct credentials.

NEW QUESTION # 112
An organization has 3 data center sites and is implementing a solution to achieve a Recovery Point Objective (RPO) of 0 to ensure continuous availability of storage in the event of a single site failure. The sites are connected via a high bandwidth/low latency link. Which two VMware Cloud Foundation (VCF) components can be used to support this capability? (Choose two.)

- A. vSphere Replication
- B. vSAN
- C. Aria Operations
- D. NSX
- E. vSphere

Answer: B,E

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To achieve an RPO of 0 (zero data loss) with continuous availability of storage across multiple sites, VMware Cloud Foundation leverages two key components:

vSphere (A): vSphere provides the core platform for compute virtualization, including features such as VMware vSphere HA (High Availability) and VMware vSphere Fault Tolerance, both of which are integral to delivering continuous VM availability and supporting cross-site failover.

vSAN (E): vSAN can be configured in a stretched cluster deployment across the three sites. With a stretched vSAN cluster, data is synchronously replicated between sites, ensuring that all writes are committed to more than one location. This synchronous replication provides true continuous availability and a Recovery Point Objective (RPO) of 0 in the event of a single site failure, provided that the network meets high bandwidth and low latency requirements.

Other components such as Aria Operations and NSX do not provide storage-level availability or synchronous data protection. vSphere Replication only supports asynchronous replication and cannot guarantee RPO of 0.
