Amazon AWS Certified AI Practitioner Sample Questions (Q194-Q199):

NEW QUESTION # 194

A company is deploying AI/ML models by using AWS services. The company wants to offer transparency into the models' decision-making processes and provide explanations for the model outputs.

- A. Amazon Lex
- B. Amazon Comprehend
- **C. Amazon SageMaker Model Cards**
- D. Amazon Rekognition

Answer: C

Explanation:

Comprehensive and Detailed

Amazon SageMaker Model Cards document model details, performance, intended use cases, and risk considerations. They support responsible AI by improving transparency and governance.

Rekognition is computer vision.

Comprehend is NLP for entity/sentiment.

Lex is conversational AI.

NEW QUESTION # 195

A medical company wants to develop an AI application that can access structured patient records, extract relevant information, and generate concise summaries.

Which solution will meet these requirements?

- A. Use Amazon Textract to convert scanned documents into digital text. Design a keyword extraction system to generate summaries.
- B. Implement Amazon Kendra to provide a searchable index for medical records. Use a template-based system to format summaries.
- **C. Use Amazon Comprehend Medical to extract relevant medical entities and relationships. Apply rule-based logic to structure and format summaries.**
- D. Use Amazon Personalize to analyze patient engagement patterns. Integrate the output with a general purpose text summarization tool.

Answer: C

NEW QUESTION # 196

A company wants to create a chatbot that answers questions about human resources policies. The company is using a large language model (LLM) and has a large digital documentation base.

Which technique should the company use to optimize the generated responses?

- A. Use few-shot prompting.
- B. Set the temperature to 1.
- **C. Use Retrieval Augmented Generation (RAG).**
- D. Decrease the token size.

Answer: C

Explanation:

The company is building a chatbot using an LLM to answer questions about HR policies, with access to a large digital documentation base. Retrieval Augmented Generation (RAG) optimizes the LLM's responses by retrieving relevant information from the documentation base and using it to generate accurate, contextually grounded answers, reducing hallucinations and improving response quality.

Exact Extract from AWS AI Documents:

From the AWS Bedrock User Guide:

"Retrieval Augmented Generation (RAG) enhances the performance of large language models by retrieving relevant information from external knowledge bases, such as documentation or databases, and incorporating it into the generation process. This technique ensures responses are accurate and grounded in the provided data, making it ideal for applications like policy chatbots." (Source: AWS Bedrock User Guide, Retrieval Augmented Generation) Detailed Explanation:

* Option A: Use Retrieval Augmented Generation (RAG). This is the correct answer. RAG leverages the documentation base to provide the LLM with relevant HR policy information, optimizing the chatbot's responses for accuracy and relevance.

* Option B: Use few-shot prompting. Few-shot prompting provides a few examples in the prompt to guide the LLM, but it is less effective than RAG for large documentation bases, as it cannot dynamically retrieve specific policy details.

* Option C: Set the temperature to 1. Setting the temperature to 1 controls the randomness of the LLM's output but does not optimize responses using external documentation. This option is unrelated to the documentation base.

* Option D: Decrease the token size. Decreasing token size (likely referring to limiting input/output tokens) may reduce response length but does not optimize the quality of responses using the documentation base.

NEW QUESTION # 197

A company is using a pre-trained large language model (LLM) to build a chatbot for product recommendations. The company needs the LLM outputs to be short and written in a specific language.

Which solution will align the LLM response quality with the company's expectations?

- A. Adjust the prompt.
- B. Increase the temperature.
- C. Increase the Top K value.
- D. Choose an LLM of a different size.

Answer: A

Explanation:

Adjusting the prompt is the correct solution to align the LLM outputs with the company's expectations for short, specific language responses.

Adjust the Prompt:

Modifying the prompt can guide the LLM to produce outputs that are shorter and tailored to the desired language.

A well-crafted prompt can provide specific instructions to the model, such as "Answer in a short sentence in Spanish." Why Option A is Correct:

Control Over Output: Adjusting the prompt allows for direct control over the style, length, and language of the LLM outputs.

Flexibility: Prompt engineering is a flexible approach to refining the model's behavior without modifying the model itself.

Why Other Options are Incorrect:

B: Choose an LLM of a different size: The model size does not directly impact the response length or language.

C: Increase the temperature: Increases randomness in responses but does not ensure brevity or specific language.

D: Increase the Top K value: Affects diversity in model output but does not align directly with response length or language specificity.

NEW QUESTION # 198

A company wants more customized responses to its generative AI models' prompts.

Select the correct customization methodology from the following list for each use case. Each use case should be selected one time.
