Candidates will be tested on their knowledge of AWS services such as AWS CloudFormation, AWS Elastic Beanstalk, AWS CodeDeploy, AWS CodePipeline, and AWS CloudWatch.

Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q138-Q143):

NEW QUESTION # 138

An Information Security policy requires that all publicly accessible systems be patched with critical OS security patches within 24 hours of a patch release. All instances are tagged with the Patch Group key set to 0. Two new AWS Systems Manager patch baselines for Windows and Red Hat Enterprise Linux (RHEL) with zero-day delay for security patches of critical severity were created with an auto-approval rule. Patch Group 0 has been associated with the new patch baselines.

Which two steps will automate patch compliance and reporting? (Select TWO.)

- A. Use the AWS Systems Manager Run Command to associate the AWS-ApplyPatchBaseline document with instances tagged with Patch Group 0.

- **B. Create an AWS Systems Manager State Manager configuration.**
Associate the AWS-RunPatchBaseline task with the configuration and add a target with Patch Group 0.
- C. Create an AWS Systems Manager Maintenance Window and add a target with Patch Group 0.
Add a task that runs the AWS-ApplyPatchBaseline document with a daily schedule.
- D. Create an AWS Systems Manager Maintenance Window and add a target with Patch Group 0.
Add a task that runs the AWS-InstallWindowsUpdates document with a daily schedule.
- **E. Create an AWS Systems Manager Maintenance Window with a daily schedule and add a target with Patch Group 0. Add a task that runs the AWS-RunPatchBaseline document with the Install action.**

Answer: B,E

Explanation:

AWS-ApplyPatchBaseline and AWS-InstallWindowsUpdates only support Windows instances.

Only AWS-RunPatchBaseline supports both Windows and Linux systems as well.

NEW QUESTION # 139

A company wants to use AWS CloudFormation for infrastructure deployment. The company has strict tagging and resource requirements and wants to limit the deployment to two Regions.

Developers will need to deploy multiple versions of the same application.

Which solution ensures resources are deployed in accordance with company policy?

- A. Create AWS Trusted Advisor checks to find and remediate unapproved CloudFormation StackSets.
- **B. Create CloudFormation StackSets with approved CloudFormation templates.**
- C. Create a CloudFormation drift detection operation to find and remediate unapproved CloudFormation StackSets.
- D. Create AWS Service Catalog products with approved CloudFormation templates.

Answer: B

NEW QUESTION # 140

You need your API backed by DynamoDB to stay online during a total regional AWS failure. You can tolerate a couple minutes of lag or slowness during a large failure event, but the system should recover with normal operation after those few minutes. What is a good approach?

- A. Set up a DynamoDB Multi-Region table. Create a cross-region ELB pointing to a cross-region Auto Scaling Group, and direct a Route53 Latency DNS Record with DNS Failover to the cross-region ELB.
- B. Set up a DynamoDB Multi-Region table. Create an Auto Scaling Group behind an ELB in each of the two regions DynamoDB is running in. Add a Route53 Latency DNS Record with DNS Failover, using the ELBs in the two regions as the resource records.
- **C. Set up DynamoDB cross-region replication in a master-standby configuration, with a single standby in another region. Create an Auto Scaling Group behind an ELB in each of the two regions DynamoDB is running in. Add a Route53 Latency DNS Record with DNS Failover, using the ELBs in the two regions as the resource records.**
- D. Set up DynamoDB cross-region replication in a master-standby configuration, with a single standby in another region. Create a cross-region ELB pointing to a cross-region Auto Scaling Group, and direct a Route53 Latency DNS Record with DNS Failover to the cross-region ELB.

Answer: C

Explanation:

There is no such thing as a cross-region ELB, nor such thing as a cross-region Auto Scaling Group, nor such thing as a DynamoDB Multi-Region Table. The only option that makes sense is the cross-regional replication version with two ELBs and ASGs with Route53 Failover and Latency DNS.

NEW QUESTION # 141

An application is running on Amazon EC2. It has an attached IAM role that is receiving an AccessDenied error while trying to access a SecureString parameter resource in the AWS Systems Manager Parameter Store.

The SecureString parameter is encrypted with a customer-managed Customer Master Key (CMK). What steps should the DevOps Engineer take to grant access to the role while granting least privilege? (Select three.)

- A. Set kms:Decrypt for the parameter resource in the customer-managed CMK policy.
- B. Set kms:Decrypt for the instance role in the customer-managed CMK policy.
- C. Set kms:Decrypt for the customer-managed CMK resource in the role's IAM policy.
- D. Set kms:GenerateDataKey for the user on the AWS managed SSM KMS key.
- E. Set ssm:DecryptParameter for the parameter resource in the instance role IAM policy.
- F. Set ssm:GetParameter for the parameter resource in the instance role's IAM policy.

Answer: A,B,F

NEW QUESTION # 142

A company has built a web service that runs on Amazon EC2 instances behind an Application Load Balancer (ALB). The company has deployed the application in us-east-1. Amazon Route 53 provides an external DNS that routes traffic from example.com to the application, created with appropriate health checks.

The company has deployed a second environment for the application in eu-west-1. The company wants traffic to be routed to whichever environment results in the best response time for each user. If there is an outage in one Region, traffic should be directed to the other environment.

Which configuration will achieve these requirements?

- A. A subdomain us.example.com with failover routing: the US ALB as primary and the EU ALB as secondary. Another subdomain eu.example.com with failover routing: the EU ALB as primary and the US ALB as secondary. Latency-based routing records for example.com that are aliased to us.example.com and eu.example.com.
- B. A subdomain us.example.com with latency-based routing: the US ALB as the first target and the EU ALB as the second target. Another subdomain eu.example.com with latency-based routing: the EU ALB as the first target and the US ALB as the second target. Failover routing records for example.com aliased to us.example.com as the first target and eu.example.com as the second target.
- C. A subdomain us.example.com with multivalued answer routing: the US ALB first and the EU ALB second. Another subdomain eu.example.com with multivalued answer routing: the EU ALB first and the US ALB second. Failover routing records for example.com that are aliased to us.example.com and eu.example.com.
- D. A subdomain us.example.com with weighted routing: the US ALB with weight 2 and the EU ALB with weight 1. Another subdomain eu.example.com with weighted routing: the EU ALB with weight 2 and the US ALB with weight 1. Geolocation routing records for example.com: North America aliased to us.example.com and Europe aliased to eu.example.com.

Answer: B
