## Valid AWS-Solutions-Architect-Associate Original Questions, AWS-Solutions-Architect-Associate Valid Exam Guide

In today's rapidly changing Amazon industry, the importance of obtaining Amazon AWS-Solutions-Architect-Associate certification has become increasingly evident. With the constant evolution of technology, staying competitive in the job market requires professionals to continuously upgrade their skills and knowledge. The Pass4SureQuiz is committed to completely assisting you in exam preparation with AWS-Solutions-Architect-Associate Questions. Success in the AWS Certified Solutions Architect - Associate (SAA-C03) (AWS-Solutions-Architect-Associate) certification exam is crucial in the tech sector, where the stakes are high, and a single mistake can have significant consequences.

## Amazon AWS Certified Solutions Architect - Associate (SAA-C03) Sample Questions (Q555-Q560):

### NEW QUESTION # 555

You need to set up security for your VPC and you know that Amazon VPC provides two features that you can use to increase security for your VPC: Security groups and network access control lists (ACLs). You start to look into security groups first. Which statement below is incorrect in relation to security groups?

- A. Evaluate all rules before deciding whether to allow traffic.
- **B. Support allow rules and deny rules.**
- C. Are stateful: Return traffic is automatically allowed, regardless of any rules.

- D. Operate at the instance level (first layer of defense).

**Answer: B**

Explanation:

Amazon VPC provides two features that you can use to increase security for your VPC:

Security groups-Act as a firewall for associated Amazon EC2 instances, controlling both inbound and outbound traffic at the instance level and supports allow rules only.

Network access control lists (ACLs)-Act as a firewall for associated subnets, controlling both inbound and outbound traffic at the subnet level and supports allow rules and deny rules.

#### NEW QUESTION # 556

A company is running a multi-tier recommence web application in the AWS Cloud. The application runs on Amazon EC2 instances with an Amazon RDS for MySQL Multi-AZ DB instance. Amazon RDS is configured with the latest generation DB instance with 2,000 GB of storage in a General Purpose SSD (gp3) Amazon Elastic Block Store (Amazon EBS) volume. The database performance affects the application during periods of high demand.

A database administrator analyzes the logs in Amazon CloudWatch Logs and discovers that the application performance always degrades when the number of read and write IOPS is higher than 20,000.

What should a solutions architect do to improve the application performance?

- A. Replace the volume with a magnetic volume.
- B. Increase the number of IOPS on the gp3 volume.
- C. Replace the 2,000 GB gp3 volume with two 1,000 GB gp3 volumes
- **D. Replace the volume with a Provisioned IOPS SSD (io2) volume.**

**Answer: D**

#### NEW QUESTION # 557

An application running on an Amazon EC2 instance in VPC-A needs to access files in another EC2 instance in VPC-B. Both are in separate AWS accounts. The network administrator needs to design a solution to enable secure access to EC2 instance in VPC-B from VPC-A. The connectivity should not have a single point of failure or bandwidth concerns.

Which solution will meet these requirements?

- **A. Create a private virtual interface (VIF) for the EC2 instance running in VPC-B and add appropriate routes from VPC-B.**
- B. Attach a virtual private gateway to VPC-B and enable routing from VPC-A.
- C. Set up VPC gateway endpoints for the EC2 instance running in VPC-B.
- D. Set up a VPC peering connection between VPC-A and VPC-B.

**Answer: A**

#### NEW QUESTION # 558

A company wants to direct its users to a backup static error page if the company's primary website is unavailable. The primary website's DNS records are hosted in Amazon Route 53. The domain is pointing to an Application Load Balancer (ALB). The company needs a solution that minimizes changes and infrastructure overhead.

Which solution will meet these requirements?

- A. Update the Route 53 records to use a latency routing policy. Add a static error page that is hosted in an Amazon S3 bucket to the records so that the traffic is sent to the most responsive endpoints.
- **B. Set up a Route 53 active-passive failover configuration. Direct traffic to a static error page that is hosted in an Amazon S3 bucket when Route 53 health checks determine that the ALB endpoint is unhealthy.**
- C. Set up a Route 53 active-active configuration with the ALB and an Amazon EC2 instance that hosts a static error page as endpoints. Configure Route 53 to send requests to the instance only if the health checks fail for the ALB.
- D. Update the Route 53 records to use a multivalue answer routing policy. Create a health check. Direct traffic to the website if the health check passes. Direct traffic to a static error page that is hosted in Amazon S3 if the health check does not pass.

**Answer: B**

Explanation:

This solution meets the requirements of directing users to a backup static error page if the primary website is unavailable, minimizing changes and infrastructure overhead. Route 53 active-passive failover configuration can route traffic to a primary resource when it is healthy or to a secondary resource when the primary resource is unhealthy. Route 53 health checks can monitor the health of the ALB endpoint and trigger the failover when needed. The static error page can be hosted in an S3 bucket that is configured as a website, which is a simple and cost-effective way to serve static content.

Option A is incorrect because using a latency routing policy can route traffic based on the lowest network latency for users, but it does not provide failover functionality. Option C is incorrect because using an active-active configuration with the ALB and an EC2 instance can increase the infrastructure overhead and complexity, and it does not guarantee that the EC2 instance will always be healthy. Option D is incorrect because using a multivalue answer routing policy can return multiple values for a query, but it does not provide failover functionality.

### NEW QUESTION # 559

A company recently started using Amazon Aurora as the data store for its global ecommerce application. When large reports are run, developers report that the ecommerce application is performing poorly. After reviewing metrics in Amazon CloudWatch, a solutions architect finds that the ReadIOPS and CPU Utilization metrics are spiking when monthly reports run.

What is the MOST cost-effective solution?

- A. Migrate the monthly reporting to Amazon Redshift.
- B. Migrate the Aurora database to a larger instance class.
- C. Migrate the monthly reporting to an Aurora Replica.
- **D. Increase the Provisioned IOPS on the Aurora instance.**

**Answer: D**
