Amazon CLF-C02 Exam Syllabus Topics:

Topic	Details
Topic 1	• Security and Compliance: This section involves understanding the shared responsibility framework of AWS in addition to compliance and governance. It also involves exploring the management capabilities of AWS by exploring its security capabilities.
Topic 2	• Cloud Technology and Services: Describe ways to access AWS services in AWS Cloud and explore connectivity options. It deals with defining the global infrastructure of AWS, computing services, and network services.
Topic 3	• Cloud Concepts: This section involves knowledge of value proposition and exploring design rules of AWS. It covers the advantages of techniques for moving over to AWS cloud and developing a good understanding of cloud economics.
Topic 4	• Billing, Pricing, and Support: This section contrasts pricing methods and budgeting resources management. It also tests understanding of billing methods, identifying support options, and technical resources.

Amazon AWS Certified Cloud Practitioner Sample Questions (Q828-Q833):

NEW QUESTION # 828

Which options are AWS Cloud Adoption Framework (AWS CAF) people perspective capabilities? (Select TWO.)

- A. Risk management
- B. Portfolio management
- C. Modern application development
- **D. Organization design**
- **E. Organizational alignment**

Answer: D,E

Explanation:

Explanation

The AWS Cloud Adoption Framework (AWS CAF) people perspective capabilities are the organizational skills and processes that enable effective cloud adoption. According to the AWS CAF people perspective whitepaper¹, there are seven capabilities in this perspective, two of which are:

Organizational alignment: This capability helps you align your organizational structure, roles, and responsibilities to support your cloud transformation goals and objectives. It involves assessing your current and desired state of alignment, identifying gaps and misalignments, and designing and implementing changes to optimize your cloud performance¹.

Organization design: This capability helps you design and evolve your organization to enable agility, innovation, and collaboration in the cloud. It involves defining your cloud operating model, identifying the skills and competencies needed for cloud roles, and creating career paths and development plans for your cloud workforce¹.

The other options are not capabilities in the AWS CAF people perspective. Portfolio management, risk management, and modern application development are capabilities in the AWS CAF business perspective, governance perspective, and platform perspective respectively².

NEW QUESTION # 829

Which tasks are customer responsibilities according to the AWS shared responsibility model? (Select TWO.)

- **A. Provide user access with AWS Identity and Access Management (IAM).**
- B. Patch the hypervisor.
- C. Determine application dependencies with operating systems.
- D. Secure the data center in an Availability Zone.
- E. Provide network availability in Availability Zones.

Answer: A

Explanation:

Explanation

The correct answer to the question is B because providing user access with AWS Identity and Access Management (IAM) is a customer responsibility according to the AWS shared responsibility model. The AWS shared responsibility model is a framework that defines the division of responsibilities between AWS and the customer for security and compliance. AWS is responsible for the security of the cloud, which includes the global infrastructure, such as the regions, availability zones, and edge locations; the hardware, software, networking, and facilities that run the AWS services; and the virtualization layer that separates the customer instances and storage. The customer is responsible for the security in the cloud, which includes the customer data, the guest operating systems, the applications, the identity and access management, the firewall configuration, and the encryption. IAM is an AWS service that enables customers to manage access and permissions to AWS resources and services. Customers are responsible for creating and managing IAM users, groups, roles, and policies, and ensuring that they follow the principle of least privilege.

NEW QUESTION # 830

An online gaming company hosts its gaming application on AWS. The company needs to decrease latency by sending internet traffic to the application through AWS infrastructure.

- A. AWS Direct Connect
- B. AWS VPN
- **C. AWS Global Accelerator**
- D. Amazon Route 53

Answer: C

NEW QUESTION # 831

A company runs a database on Amazon Aurora in the us-east-1 Region. The company has a disaster recovery requirement that the database be available in another Region.

Which solution meets this requirement with minimal disruption to the database operations?

- A. Perform an Aurora Multi-AZ deployment.
- B. Deploy Aurora Replicas.
- C. Create Amazon Elastic Block Store (Amazon EBS) volume snapshots for Aurora and copy them to another Region.
- **D. Deploy Aurora cross-Region read replicas.**

Answer: D

Explanation:

The solution that meets the requirement of the company that runs a database on Amazon Aurora in the us-east-1 Region and has a disaster recovery requirement that the database be available in another Region with minimal disruption to the database operations is to deploy Aurora cross-Region read replicas. Aurora cross-Region read replicas are secondary Aurora clusters that are created in a different AWS Region from the primary Aurora cluster, and are kept in sync with the primary cluster using physical replication. The company can use Aurora cross-Region read replicas to improve the availability and durability of the database, as well as to reduce the recovery time objective (RTO) and recovery point objective (RPO) in case of a regional disaster. Performing an Aurora Multi-AZ deployment, creating Amazon EBS volume snapshots for Aurora and copying them to another Region, and deploying Aurora Replicas are not the best solutions for this requirement. An Aurora Multi-AZ deployment is a configuration that creates one or more Aurora Replicas within the same AWS Region as the primary Aurora cluster, and provides automatic failover in case of an Availability Zone outage. However, this does not provide cross-Region disaster recovery. Creating Amazon EBS volume snapshots for Aurora and copying them to another Region is a manual process that requires stopping the database, creating the snapshots, copying them to the target Region, and restoring them to a new Aurora cluster. This process can cause significant downtime and data loss. Deploying Aurora Replicas is a configuration that creates one or more secondary Aurora clusters within the same AWS Region as the primary Aurora cluster, and provides read scaling and high availability. However, this does not provide cross-Region disaster recovery.

NEW QUESTION # 832

Which fully managed AWS service assists with the creation, testing, and management of custom Amazon EC2 images?

- A. AWS Launch Wizard
- **B. EC2 Image Builder**
- C. AWS Elastic Beanstalk
- D. Amazon Machine Image (AMI)

Answer: B

Explanation:

* Understanding EC2 Image Builder: EC2 Image Builder is a fully managed service that simplifies the creation, maintenance, validation, and testing of Amazon Machine Images (AMIs).

* Why Use EC2 Image Builder:

* Automation: Automates the creation and management of AMIs, reducing manual efforts and the risk of errors.

* Customization: Allows you to customize the images to include necessary software, configurations, and security settings.

* Compliance: Ensures that the images comply with your security and operational standards through continuous monitoring and testing.

* How to Implement EC2 Image Builder:

- * **Create a Recipe:** Define an image recipe specifying the base image and components to be included.
- * **Build Pipeline:** Set up an image pipeline that automates the building and testing of the AMI based on a schedule or trigger.
- * **Distribute Images:** Use the produced AMIs across multiple AWS regions and accounts as needed.
