Amazon AWS Certified Cloud Practitioner Sample Questions (Q143-Q148):

NEW QUESTION # 143

Which AWS network services or features allow CIDR block notation when providing an IP address range?
(Select TWO.)

- A. Amazon Machine Image (AMI)
- **B. Network access control list (network ACL)**
- C. Amazon Elastic Block Store (Amazon EBS)
- **D. Security groups**
- E. AWS Budgets

Answer: B,D

Explanation:

Explanation

Security groups and network access control lists (network ACLs) are two AWS network services or features that allow CIDR block notation when providing an IP address range. Security groups act as a firewall for associated Amazon EC2 instances, controlling both inbound and outbound traffic at the instance level.

Network ACLs act as a firewall for associated subnets, controlling both inbound and outbound traffic at the subnet level. Both security groups and network ACLs use CIDR block notation to specify the IP address ranges that are allowed or denied

NEW QUESTION # 144

A company is running a reporting web server application on Amazon EC2 instances. The application runs once every week and once again at the end of the month. The EC2 instances can be shut down when they are not in use.

What is the MOST cost-effective billing model for this use case?

- **A. On-Demand Instances**
- B. On-Demand Capacity Reservations
- C. Convertible Reserved Instances
- D. Standard Reserved Instances

Answer: A

Explanation:

For a reporting application that runs only periodically, On-Demand Instances are the most cost-effective choice because they allow the company to pay only for the compute capacity used, without long-term commitments. Reserved Instances are less flexible due to the need for upfront payment or long-term contracts, which would not be cost-effective given the application's intermittent usage.

On-Demand Capacity Reservations would also be more costly, as they hold capacity regardless of usage.

NEW QUESTION # 145

Which AWS service or feature will search for and identify AWS resources that are shared externally?

- A. AWS Control Tower
- B. AWS Fargate
- **C. AWS IAM Access Analyzer**
- D. Amazon OpenSearch Service

Answer: C

Explanation:

AWS IAM Access Analyzer is an AWS service that helps customers identify and review the resources in their AWS account that are shared with an external entity, such as another AWS account, a root user, an organization, or a public entity. AWS IAM Access Analyzer uses automated reasoning, a form of mathematical logic and inference, to analyze the resource-based policies in the account and generate comprehensive findings that show the access level, the source of the access, the affected resource, and the

condition under which the access applies. Customers can use AWS IAM Access Analyzer to audit their shared resources, validate their access policies, and monitor any changes to the resource sharing status. NEW QUESTION # 146

A company wants to minimize network latency between its Amazon EC2 instances. The EC2 instances do not need to be highly available.

Which solution meets these requirements?

- A. Use EC2 instances in the same edge location and the same Availability Zone.
- **B. Use EC2 instances in a single Availability Zone.**
- C. Use EC2 instances in the same edge location and the same AWS Region.
- D. Use Amazon CloudFront as the database for the EC2 instances.

Answer: B

Explanation:

Using EC2 instances in a single Availability Zone is a solution that meets the requirements of minimizing network latency between the EC2 instances and not needing high availability. An Availability Zone is a physically isolated location within an AWS Region that has its own power, cooling, and network connectivity. EC2 instances within the same Availability Zone can communicate with each other using low-latency private IP addresses. However, EC2 instances in a single Availability Zone are not highly available, because they are vulnerable to failures or disruptions that affect the Availability Zone

NEW QUESTION # 147

Which AWS service will allow a user to set custom cost and usage limits, and will alert when the thresholds are exceeded?

- A. AWS Trusted Advisor
- B. AWS Organizations
- **C. AWS Budgets**
- D. Cost Explorer

Answer: C

Explanation:

Explanation

AWS Budgets allows you to set custom budgets that alert you when your costs or usage exceed (or are forecasted to exceed) your budgeted amount. You can also use AWS Budgets to set reservation utilization or coverage targets and receive alerts when your utilization drops below the threshold you define. AWS Budgets provides you with a comprehensive view of your cost and usage, as well as your reservation utilization and coverage1.
