Amazon AWS Certified Solutions Architect - Associate Sample Questions (Q444-Q449):

NEW QUESTION # 444
A company wants to create a long-term storage solution that will allow users to upload terabytes of images and videos. The company will use the images and videos to train machine learning (ML) models. The storage solution must be scalable and cost-optimized.
Which solution will meet these requirements?

- A. Provision an Amazon S3 bucket for users to upload images and videos. Copy the data from the S3 bucket to an Amazon FSx for Lustre file system to make the data available for ML model training.
- B. Provision an Amazon S3 bucket for users to upload images and videos. Configure the S3 bucket to make the data available to Amazon SageMaker AI training. Store the data in the S3 Intelligent-Tiering storage class.
- C. Provision an Amazon S3 bucket for users to upload images and videos. Copy the data from the S3 bucket to an Amazon Elastic File System (Amazon EFS) file system to make the data available for ML model training.
- D. Configure an Amazon SageMaker AI notebook instance with 16 GB of storage. Create a custom application to allow users to upload images and videos directly to the notebook instance.

Answer: B

Explanation:
Amazon S3 is the most scalable and cost-optimized object storage for large amounts of data. It integrates natively with Amazon SageMaker, which allows direct access to S3 data for machine learning training jobs without the need to copy data elsewhere. The S3 Intelligent-Tiering storage class further optimizes storage costs for data with unknown or changing access patterns, while maintaining immediate availability for ML training.
Copying to FSx for Lustre or EFS adds unnecessary complexity and cost unless ultra-high throughput POSIX file access is specifically required, which is not mentioned here.
AWS Documentation Extract:
"Amazon S3 provides cost-effective storage for ML data sets, and Amazon SageMaker can directly access data in S3. S3 Intelligent-Tiering automatically moves data between frequent and infrequent access tiers, optimizing costs for changing data access patterns." (Source: AWS S3 and SageMaker documentation) A, D: FSx for Lustre or EFS may be used in specialized cases but are not cost-optimized for general large- scale ML data storage.
C: SageMaker notebook instance storage is not designed for large-scale data ingestion or long-term storage.

NEW QUESTION # 445
A company that primarily runs its application servers on premises has decided to migrate to AWS. The company wants to minimize its need to scale its Internet Small Computer Systems Interface (iSCSI) storage on premises. The company wants only its recently accessed data to remain stored locally.
Which AWS solution should the company use to meet these requirements?

- A. AWS Storage Gateway Volume Gateway stored volumes
- B. AWS Storage Gateway Volume Gateway cachea volumes
- C. AWS Storage Gateway Tape Gateway
- D. Amazon S3 File Gateway

Answer: B

Explanation:
AWS Storage Gateway Volume Gateway provides two configurations for connecting to iSCSI storage, namely, stored volumes and cached volumes. The stored volume configuration stores the entire data set on-premises and asynchronously backs up the data to AWS. The cached volume configuration stores recently accessed data on-premises, and the remaining data is stored in Amazon S3. Since the company wants only its recently accessed data to remain stored locally, the cached volume configuration would be the most appropriate. It allows the company to keep frequently accessed data on-premises and reduce the need for scaling its iSCSI storage while still providing access to all data through the AWS cloud. This configuration also provides low-latency access to

frequently accessed data and cost-effective off-site backups for less frequently accessed data.

NEW QUESTION # 446

A solutions architect needs to optimize a large data analytics job that runs on an Amazon EMR cluster. The job takes 13 hours to finish. The cluster has multiple core nodes and worker nodes deployed on large, compute-optimized instances.

After reviewing EMR logs, the solutions architect discovers that several nodes are idle for more than 5 hours while the job is running. The solutions architect needs to optimize cluster performance.

Which solution will meet this requirement MOST cost-effectively?

- A. Use the EMR managed scaling feature to automatically resize the cluster based on workload.
- B. Migrate the analytics job core nodes to a memory-optimized instance type to reduce the total job runtime.
- C. Increase the number of core nodes to ensure there is enough processing power to handle the analytics job without any idle time.
- D. Migrate the analytics job to a set of AWS Lambda functions. Configure reserved concurrency for the functions.

Answer: A

Explanation:
EMR managed scaling dynamically resizes the cluster by adding or removing nodes based on the workload. This feature helps minimize idle time and reduces costs by scaling the cluster to meet processing demands efficiently.
Option A:Increasing the number of core nodes might increase idle time further, as it does not address the root cause of underutilization.
Option C:Migrating the job to Lambda is infeasible for large analytics jobs due to resource and runtime constraints.
Option D:Changing to memory-optimized instances may not necessarily reduce idle time or optimize costs.

NEW QUESTION # 447

A company is building a new dynamic ordering website. The company wants to minimize server maintenance and patching. The website must be highly available and must scale read and write capacity as quickly as possible to meet changes in user demand. Which solution will meet these requirements?

- A. Host al the website content on Amazon EC2 instances Create an Auto Scaling group to scale the EC2 Instances Use an Application Load Balancer to distribute traffic Use Amazon DynamoDB with provisioned write capacity for the database
- B. Host static content in Amazon S3 Host dynamic content by using Amazon API Gateway and AWS Lambda Use Amazon DynamoDB with on-demand capacity for the database Configure Amazon CloudFront to deliver the website content
- C. Host static content in Amazon S3 Host dynamic content by using Amazon API Gateway and AWS Lambda Use Amazon Aurora with Aurora Auto Scaling for the database Configure Amazon CloudFront to deliver the website content
- D. Host at the website content on Amazon EC2 instances Create an Auto Scaling group to scale the EC2 instances Use an Application Load Balancer to distribute traffic Use Amazon Aurora with Aurora Auto Scaling for the database

Answer: B

Explanation:
Key phrase in the Question is must scale read and write capacity. Aurora is only for Read. Amazon DynamoDB has two read/write capacity modes for processing reads and writes on your tables: On-demand Provisioned (default, free-tier eligible)

NEW QUESTION # 448

A company that hosts its web application on AWS wants to ensure all Amazon EC2 instances. Amazon RDS DB instances. and Amazon Redshift clusters are configured with tags. The company wants to minimize the effort of configuring and operating this check.
What should a solutions architect do to accomplish this?

- A. Use Cost Explorer to display resources that are not properly tagged. Tag those resources manually.
- B. Write API calls to check all resources for proper tag allocation. Schedule an AWS Lambda function through Amazon

CloudWatch to periodically run the code.
- C. Write API calls to check all resources for proper tag allocation. Periodically run the code on an EC2 instance.
- D. Use AWS Config rules to define and detect resources that are not properly tagged.

Answer: D

Explanation:
To ensure all Amazon EC2 instances, Amazon RDS DB instances, and Amazon Redshift clusters are configured with tags, a solutions architect should use AWS Config rules to define and detect resources that are not properly tagged. AWS Config rules are a set of customizable rules that AWS Config uses to evaluate AWS resource configurations for compliance with best practices and company policies. Using AWS Config rules can minimize the effort of configuring and operating this check because it automates the process of identifying non-compliant resources and notifying the responsible teams.
