

Analytics-Arch-201 Bestehen Sie Salesforce Certified Tableau Architect! - mit höhere Effizienz und weniger Mühen

Egal wie attraktiv die Vorstellung ist, ist nicht so überzeugend wie Ihre eigene Empfindung. Die Demo der Salesforce Analytics-Arch-201 Software können Sie auf unsere Webseite It-Pruefung einfach herunterladen. Unser erfahrenes Team bieten Ihnen die zuverlässigsten Unterlagen der Salesforce Analytics-Arch-201. Wenn Sie noch Fragen über Salesforce Analytics-Arch-201 Prüfungsunterlagen haben, können Sie sich auf unsere Website online darüber konsultieren. Onlinedienst bieten wir ganztägig.

Salesforce Analytics-Arch-201 Prüfungsplan:

Thema	Einzelheiten
Thema 1	• Monitor and Maintain a Tableau Deployment: This section evaluates skills of Tableau Administrators in monitoring, maintaining, and optimizing Tableau environments. It involves creating custom administrative dashboards, conducting load testing using tools like TabJolt, and analyzing test results. Troubleshooting complex performance bottlenecks in workbooks and server resources is key, as is tuning caching and scaling strategies. It covers leveraging observability tools such as the Resource Monitoring Tool, analyzing logs and metrics, and adjusting architecture accordingly. Automation of maintenance functions using APIs, scripting, and scheduling is included, along with managing server extensions, content automation, dashboard extensions, web data connectors, and secure embedded solutions.
Thema 2	• Design a Tableau Infrastructure: This section of the exam measures skills of Tableau Consultants and focuses on planning and designing a complex Tableau deployment. It covers gathering user requirements, licensing strategies including Authorization-to-Run, high availability and disaster recovery planning, and mapping server add-ons to the organization's needs. It includes planning and implementing Tableau Cloud with Bridge, authentication, user provisioning, and multi-site configuration. Additionally, it addresses migration planning across Tableau products, operating systems, identity stores, and consolidations, as well as designing process topologies, sizing, node roles, and recommending server configurations including security, hardware, and disaster recovery.

Thema 3	• Deploy Tableau Server: This domain assesses the ability of Tableau Administrators to perform production-ready deployments of Tableau Server. It encompasses installing and configuring Tableau Server with external components, supporting air-gapped environments, disaster recovery validations, and blue-green deployments. It includes configuring and troubleshooting various authentication methods such as SAML, Kerberos, and LDAP. The section also covers implementing encryption strategies, installing and verifying Tableau Server on Linux and Windows platforms, resolving installation and configuration issues, and managing service accounts and logging.

Analytics-Arch-201 Fragenpool, Analytics-Arch-201 Zertifizierung

It-Prüfung bietet Ihnen die neuesten Schulungsunterlagen zur Salesforce Analytics-Arch-201 Zertifizierungsprüfung. Die fleißigen IT-Experten von It-Prüfung aktualisieren ständig Schulungsunterlagen durch ihre eigene Kompetenz und Erfahrung, so dass die IT-Fachleute die Prüfung mühelos bestehen können. Das Salesforce Analytics-Arch-201 Zertifikat stellt eine immer wichtigere Stelle in der IT-Branche dar. Und immer mehr Leute haben sich an dieser Prüfung beteiligt. Und viele davon benutzen unsere Produkte von It-Prüfung und haben die Salesforce Analytics-Arch-201 Zertifizierungsprüfung bestanden. Die Feedbacks von diesen Leute haben bewiesen, dass unsere Produkte von It-Prüfung eher zuverlässig sind.

Salesforce Certified Tableau Architect Analytics-Arch-201 Prüfungsfragen mit Lösungen (Q131-Q136):

131. Frage

You have configured Tableau Server on a Linux system behind a reverse proxy, but users are experiencing intermittent access issues. What should be the first step in troubleshooting these proxy-related issues?

- A. Verifying the configuration settings of the reverse proxy, including URL rewriting and port forwarding rules
- B. Changing the reverse proxy software to a different provider
- C. Installing a new SSL certificate directly on the Tableau Server
- D. Increasing the bandwidth of the server's internet connection

Antwort: A

Begründung:

Verifying the configuration settings of the reverse proxy, including URL rewriting and port forwarding rules When encountering access issues with Tableau Server configured behind a reverse proxy, the first step should be to verify the proxy's configuration settings. This includes checking URL rewriting rules and port forwarding settings to ensure they are correctly routing traffic to and from Tableau Server. Misconfigurations in these settings can often lead to intermittent access problems. Option A is incorrect because increasing bandwidth is unlikely to resolve issues specifically related to proxy configuration. Option C is incorrect as changing the proxy software provider is not the first troubleshooting step and may not address the root cause of the issue. Option D is incorrect because installing a new SSL certificate on Tableau Server, while important for security, does not directly address proxy configuration issues.

132. Frage

In the context of maintaining and tuning a Tableau Server environment, how can the Tableau Server Resource Monitoring Tool aid in managing server workload?

- A. By automatically adjusting server settings based on the current workload to optimize performance
- B. By offering visualization of historical server workload trends to plan for capacity adjustments
- C. By providing a detailed analysis of user interaction patterns with various dashboards and reports
- D. By monitoring external data source performance and optimizing data connections

Antwort: B

Begründung:

By offering visualization of historical server workload trends to plan for capacity adjustments The Tableau Server Resource

Monitoring Tool aids in managing server workload by offering visualizations of historical workload trends. This feature allows administrators to analyze past server performance under various loads, enabling them to make informed decisions about capacity planning and adjustments to handle future workload efficiently. Option A is incorrect because the tool focuses on server resources and workload trends rather than detailed analysis of user interactions. Option C is incorrect as the tool provides data for analysis but does not automatically adjust server settings. Option D is incorrect because the focus of the tool is on monitoring server resources and workload, not directly on external data source performance or data connections.

133. Frage

When configuring the Metadata API in Tableau Server, which step is crucial for ensuring the API's effective performance and security?

- **A. Setting up rate limits to control the number of requests to the Metadata API**
- B. Encrypting all Metadata API responses with an additional encryption layer
- C. Configuring the Metadata API to run on a separate server from the main Tableau Server
- D. Regularly changing the API key to prevent unauthorized access

Antwort: A

Begründung:

Setting up rate limits to control the number of requests to the Metadata API Setting up rate limits for the Metadata API is essential to manage the load on the Tableau Server and to prevent abuse of the API. Rate limiting helps to maintain the server's performance and stability by controlling the number and frequency of requests processed by the Metadata API. Option A is incorrect because regularly changing the API key, while a good security practice, is not specifically related to the performance and security of the Metadata API in operation. Option C is incorrect as running the Metadata API on a separate server is not a standard requirement and does not directly contribute to its effective performance. Option D is incorrect because adding an extra encryption layer to Metadata API responses is generally unnecessary and can add undue complexity, as the API should already operate under secure protocols.

134. Frage

If you encounter an error related to dependency resolution while installing Tableau Server on Linux, what should be your initial troubleshooting step?

- A. Changing the Linux server's hostname to ensure it's correctly recognized by Tableau Server
- **B. Verifying that all required dependencies are installed and up-to-date on the Linux system**
- C. Configuring the network settings to allow unrestricted internet access to the Linux server
- D. Temporarily disabling the firewall and antivirus software on the Linux server

Antwort: B

Begründung:

Verifying that all required dependencies are installed and up-to-date on the Linux system When facing a dependency resolution error during the installation of Tableau Server on Linux, the first step should be to verify that all necessary dependencies are installed and up-to-date. Dependency issues often arise from missing or outdated packages, and ensuring that the system meets all pre-installation requirements is key to resolving these issues. Option A is incorrect because disabling firewall and antivirus software does not typically address dependency resolution problems. Option C is incorrect as configuring network settings for unrestricted internet access is not a standard approach to resolving dependency issues. Option D is incorrect because changing the hostname of the server is unlikely to resolve dependency-related installation errors.

135. Frage

A company is transitioning to Tableau Cloud but still has critical data in on-premises databases that need to be accessed in real-time. What is the best solution for integrating these data sources with Tableau Cloud?

- A. Migrate all on-premises data to the cloud before using Tableau Cloud
- **B. Implement Tableau Bridge to establish a live connection to on-premises databases**
- C. Utilize Tableau Builder for real-time data integration
- D. Rely solely on Tableau Cloud's native capabilities for on-premises data integration

Antwort: B

Implement Tableau Bridge to establish a live connection to on-premises data-bases Tableau Bridge is specifically designed to allow real-time access to on-premises data from Tableau Cloud, making it the ideal solution for this scenario. Option A is incorrect because Tableau Prep Builder is used for data preparation, not for establishing live connections to on-premises data sources. Option C is incorrect as migrating all data to the cloud may not be feasible or desirable for all companies. Option D is incorrect because Tableau Cloud's native capabilities do not include direct live data connections to on-premises databases without Tableau Bridge.
