Graduate degree or worldwide comparable from a licensed foundation of advanced education and have five (5) long stretches of

safety experience*(or four years in the event that you as of now hold an APP), at any rate three (3) long periods of which will have been in capable charge of a security work.

Or on the other hand

Four year college education or worldwide identical from an authorize establishment of advanced education and have six (6) long periods of safety experience* (or five years on the off chance that you as of now hold an APP), at any rate three (3) long periods of which will have been in capable charge** of a security work.

ASIS Physical Security Professional Exam Sample Questions (Q178-Q183):

NEW QUESTION # 178

Document the events, circumstances, and chronology and prepare a "lesson learned" review are the primary parts of:

- A. Testing
- B. Quality assurance
- C. All of the above
- D. After action

Answer: D

Explanation:

An "after action" review is a structured process following an incident, drill, or actual disaster, in which events are documented, timelines are reconstructed, and lessons learned are gathered. Its purpose is to identify what went well, what failed, and what can be improved in future responses.

Testing (A) refers to evaluating procedures before an event.

Quality assurance (B) focuses on performance and compliance but not necessarily post-event analysis.

"All of the above" (D) is incorrect because only after action includes all these specific elements.

NEW QUESTION # 179

Which of the following BEST describes the operation of a passive infrared sensor?

- A. Detecting moving infrared radiation against the radiation environment of the room
- B. Detecting infrared radiation and analyzing the reflection data
- C. Transmitting and receiving infrared radiation, then detecting any changes in signals
- D. Transmitting infrared radiation into the environment of the room and detecting the changes

Answer: A

Explanation:

Passive Infrared (PIR) sensors operate by detecting changes in infrared radiation (heat) levels in a given area.

They do not emit any energy but instead sense the movement of heat signatures (typically from people) across a background that has a stable infrared profile. When a warm object moves in front of the sensor, it registers a change and triggers an alert.

B and C describe active sensors (e.g., microwave or ultrasonic).

D refers to analyzing reflected infrared, which is not how PIR sensors function.
