Which of the following indicates a susceptibility whereby an attacker can take advantage of the trust relationship between the client and the server?

- A. Line 13
- B. Line 10
- C. Line 17
- D. Line 06

Answer: D

Explanation:

The scan output in line 06 indicates that OCSP Must-Staple is not supported. This vulnerability exposes the application to attacks where an attacker can exploit the trust relationship between the client and the server by forging certificate revocation statuses. When OCSP stapling is not enforced, a client cannot reliably check if a certificate has been revoked, potentially allowing attackers to exploit this gap. CASP+ discusses the importance of certificate validation mechanisms such as OCSP (Online Certificate Status Protocol) to prevent man-in-the-middle and trust-exploiting attacks.

NEW QUESTION # 180
A company reviews the regulatory requirements associated with a new product, and then company management elects to cancel production. Which of the following risk strategies is the company using in this scenario?

- A. Acceptance
- B. Mitigation
- C. Avoidance
- D. Rejection

Answer: C

Explanation:
In this scenario, the company has elected to cancel the production of a product after reviewing regulatory requirements. This decision reflects a risk avoidance strategy, which involves taking action to eliminate exposure to a risk by not engaging in the activity that could lead to it. By canceling production, the company avoids the regulatory and compliance risks altogether. CASP+ defines risk avoidance as a risk management strategy that involves stopping or avoiding actions that expose the organization to unacceptable levels of risk.

NEW QUESTION # 181
After a server was compromised an incident responder looks at log files to determine the attack vector that was used The incident responder reviews the web server log files from the time before an unexpected SSH session began:

Date	URL
April 18 04:16	https://myapp.mycompany.com/shopping-cart.php=?orderproducts
April 18 04:18	https://myapp.mycompany.com/something.php=?../../../etc/shadow
April 18 04:21	https://myapp.mycompany.com/put_file=?admin:password
April 18 04:22	https://myapp.mycompany.com/something.php=?whoami
April 18 04:23	https://myapp.mycompany.com/shopping-cart.php=?processorder

Which of the following is the most likely vulnerability that was exploited based on the log files?

- A. Directory traversal revealed the hashed SSH password, which was used to access the server.
- B. A SQL injection was used during the ordering process to compromise the database server
- C. The root password was easily guessed and used as a parameter lo open a reverse shell
- D. An outdated third-party PHP plug-in was vulnerable to a known remote code execution

Answer: A

Explanation:
The logs indicate a directory traversal attempt (/../../.etc/shadow), which is a type of attack that exploits insufficient security validation/sanitization of user-supplied input file names, so that characters representing "traverse to parent directory" are passed through to the file APIs. The /etc/shadow file on Unix systems contains password hashes. If an attacker successfully exploited this

vulnerability, they could potentially access the hashed SSH password. This information could then be used to gain unauthorized access to the server if the hash was cracked.

NEW QUESTION # 182

A large number of emails have been reported, and a security analyst is reviewing the following information from the emails:

```
Received: From postfix.com [102.8.14.10]
Received: From prod.protection.email.comptia.com [99.5.143.140]
SPF: Pass
From: <carl.b@comptia1.com>
Subject: Subject Matter Experts
X-IncomingHeaderCount 4
Return-Path: carl.b@comptia.com
Date: Sat, 4 Oct 2020 22:01:59
```

As part of the image process, which of the following is the FIRST step the analyst should take?

- A. Block the email address carl b@comptia1 com, as it is sending spam to subject matter experts
- B. Validate the final "Received" header against the DNS entry of the domain.
- C. Ignore the emails, as SPF validation is successful, and it is a false positive
- D. Compare the 'Return-Path' and "Received" fields.

Answer: D
