Sitecore XM Cloud Developer Certification Exam Sample Questions (Q44-Q49):

NEW QUESTION # 44

When an item is published, the Experience Edge for XM Connector publishes a static snapshot of the Layout Service output of that item. If a change is made to a data source item that is referenced on the page, how is that content made visible on the website?

- A. A developer must reconnect to the Experience Edge Connector module.
- **B. A developer must publish the data source item.**
- C. A developer must publish the related page items.
- D. A developer must publish to the web database.

Answer: B

Explanation:

When a change is made to a data source item in Sitecore XM Cloud, the updated content becomes visible on the website after the data source item itself is published. This is because the Experience Edge for XM Connector publishes a static snapshot of the Layout Service output, and any changes to the data source items require republishing to reflect on the website.

References: The Sitecore XM Cloud documentation explains that the Experience Edge for XM Connector uses a static publishing model, meaning that dynamic content structures are flattened at publishing time. Therefore, if a data source item changes, it must be republished for the changes to take effect on the website¹².

NEW QUESTION # 45

Which of the following is part of the out-of-the-box technology stack for XM Cloud?

- **A. React**
- B. Svelte Kit
- C. Python
- D. jQuery

Answer: A

Explanation:

XM Cloud includes a modern technology stack that supports various frameworks and libraries for development. React is part of this stack, as it is commonly used in conjunction with Sitecore's headless services and JSS (JavaScript Services) for building dynamic user interfaces.

References: The Sitecore XM Cloud documentation mentions the use of modern frameworks and libraries, including React, as part of its technology stack¹. This aligns with the industry's move towards more flexible and modular front-end development practices.

NEW QUESTION # 46

A developer is creating a component that has the following requirements:

*Image Left, Title, Call to action

*Image Right, Title, Call to action

*Image Centered, Call to action

The component should be able to display the same content in all three options. What is the best way to build this?

- **A. One component with rendering parameters to control the layout**
- B. One component with three Headless variants
- C. Three separate components with the compatible renderings set
- D. One component with logic in the component to change the view

Answer: A

Explanation:

According to the Sitecore XM Cloud Documentation for Developers¹, rendering parameters are a way to define custom properties for a component that can be changed by the content author in the XM Cloud Pages editor. Rendering parameters allow you to create flexible and reusable components that can adapt to different scenarios and layouts. To create a component with rendering parameters, you need to follow these steps²:

Create a data template that defines the rendering parameters for your component. For example, you can create a data template with a field called Layout that has three options: Left, Right, and Center.

Create a component that uses the data template as its rendering parameter template. For example, you can create a component called Image and Text that has an image, a title, and a call to action button.

In the component's code, use the rendering parameter value to control the layout of the component. For example, you can use conditional logic or CSS classes to change the position of the image based on the Layout value.

Register the component in the Components builder and add it to the Components library.

In the XM Cloud Pages editor, drag and drop the component to the page and use the Properties panel to change the rendering parameter value. For example, you can select Left, Right, or Center from the Layout drop-down menu.

2: Create a component with rendering parameters | Sitecore Documentation¹: XM Cloud Documentation for Developers - Sitecore

NEW QUESTION # 47

Which of the following needs to happen for a developer to be able to log in into the XM Cloud Deploy app?

- A. An Organization Admin or Organization Owner must update their role using the XM Cloud Deploy app.
- **B. An Organization Admin or Organization Owner must update their role in the Sitecore Cloud Portal.**
- C. Only the Organization Owner can update their role in the Sitecore Cloud Portal.
- D. Only the Organization Owner can update their role using the XM Cloud Deploy app.

Answer: B

Explanation:

In Sitecore XM Cloud, access to the XM Cloud Deploy app is managed through the Sitecore Cloud Portal.

To allow a developer to log in, their user role must be updated to include the necessary permissions.

* The Sitecore Cloud Portal is the central place where user roles and permissions are managed.

* Only users with the correct role assignments can access the XM Cloud Deploy app.

* Both an Organization Admin and an Organization Owner have the ability to update a user's role to grant them access.

* (B) Only the Organization Owner can update their role in the Sitecore Cloud Portal # Incorrect

* The Organization Admin also has permission to manage users and update roles.

* It is not restricted to just the Organization Owner.

* (C) Only the Organization Owner can update their role using the XM Cloud Deploy app # Incorrect

* User role management cannot be done from the XM Cloud Deploy app.

* All role updates must be made in the Sitecore Cloud Portal.

* (D) An Organization Admin or Organization Owner must update their role using the XM Cloud Deploy app # Incorrect

* The XM Cloud Deploy app does not handle user management.

* Roles must be managed through the Sitecore Cloud Portal, not through XM Cloud Deploy.

Correct answer: A (An Organization Admin or Organization Owner must update their role in the Sitecore Cloud Portal) # Why

Other Options Are Incorrect:

* Log in to the Sitecore Cloud Portal (<https://portal.sitecorecloud.io>).

* Go to "User Management."

* Find the developer's user account.

* Assign the appropriate role (e.g., "Deployment User" or another suitable role).

* Save changes- the developer should now be able to access the XM Cloud Deploy app.

Steps to Grant Access to the XM Cloud Deploy App

* Sitecore Cloud Portal Documentation- Managing Users and Roles

* Sitecore XM Cloud Deployment Guide- Working with XM Cloud Deploy

* Security Best Practices in Sitecore XM Cloud- User Access Control

NEW QUESTION # 48

If a developer wants to limit the serialization of items under a Navigation item to just the item itself and then one step below, what property should the developer add to the includes to indicate this limitation?

- A. Scope
- B. Nothing-this is the default.
- **C. Limit**
- D. Name

Answer: C

Explanation:

In Sitecore XM Cloud, serialization is used to store and transfer content items between environments. If a developer wants to limit the depth of serialized items under a Navigation item to only the item itself and one level below, they must use the Limit property in the serialization configuration.

* The Limit property restricts how many levels deep the serialization will include.

* Setting Limit: 1 ensures that only the specified item (Navigation item) and its immediate children are serialized.

How the Limit Property Works: Example of Serialization Configuration: items:

includes:

- name: NavigationSerialization

path: /sitecore/content/MySite/Home/Navigation

limit: 1 # Only serializes the Navigation item and its immediate children

* In this example:

* /Navigation itself is serialized.

* Its direct children are also serialized.

* Grandchildren or deeper levels are excluded.

* Option A - Scope # Incorrect because Scope is not a valid property in Sitecore serialization includes.

* Option B - Nothing-this is the default # Incorrect because the default behavior is to serialize all descendants, not just one level. You must explicitly define a limit.

* Option D - Name # Incorrect because Name is used to label the serialization include rule and does not control serialization depth.

Why Other Options Are Incorrect? Thus, the correct answer is #C. Limit

* Sitecore Serialization in XM Cloud: <https://doc.sitecore.com/xmc/en/developers/xm-cloud/sitecore-content-serialization.html>

* YAML Serialization Configuration in Sitecore: <https://doc.sitecore.com/developers/101/sitecore-experience-manager/en/sitecore-content-serialization-yaml-configuration.html> References for XM Cloud Development:

NEW QUESTION # 49

.....

As the authoritative provider of Sitecore-XM-Cloud-Developer actual exam, we always pursue high pass rate compared with our peers to gain more attention from those potential customers. We guarantee that if you follow the guidance of our Sitecore-XM-Cloud-Developer learning materials, you will pass the exam without a doubt and get a certificate. Our Sitecore-XM-Cloud-Developer Exam Practice is carefully compiled after many years of practical effort and is adaptable to the needs of the Sitecore-XM-Cloud-Developer exam.
