Questions (Q315-Q320):

NEW QUESTION # 315

A company receives food orders from multiple partners. The company has a microservices application that uses Amazon API Gateway APIs with AWS Lambda integration. Each partner sends orders by calling a customized API that is exposed through API Gateway. The API call invokes a shared Lambda function to process the orders.

Partners need to be notified after the Lambda function processes the orders. Each partner must receive updates for only the partner's own orders. The company wants to add new partners in the future with the fewest code changes possible.

Which solution will meet these requirements in the MOST scalable way?

- A. Create a different Lambda function for each partner. Configure the Lambda function to notify each partner's service endpoint directly.
- **B. Create an Amazon Simple Notification Service (Amazon SNS) topic. Configure the Lambda function to publish messages with specific attributes to the SNS topic. Subscribe each partner to the SNS topic. Apply the appropriate filter policy to the topic subscriptions.**
- C. Create a different Amazon Simple Notification Service (Amazon SNS) topic for each partner. Configure the Lambda function to publish messages for each partner to the partner's SNS topic.
- D. Create one Amazon Simple Notification Service (Amazon SNS) topic. Subscribe all partners to the SNS topic.

Answer: B

Explanation:

Amazon Simple Notification Service (Amazon SNS) is a fully managed messaging service that enables pub/sub communication between distributed systems. The developer can create an SNS topic and configure the Lambda function to publish messages with specific attributes to the topic. The developer can subscribe each partner to the SNS topic and apply the appropriate filter policy to the topic subscriptions. This way, each partner will receive updates for only their own orders based on the message attributes. This solution will meet the requirements in the most scalable way and allow adding new partners in the future with minimal code changes.

NEW QUESTION # 316

If a message is retrieved from a queue in Amazon SQS, how long is the message inaccessible to other users by default?

- A. forever
- **B. 30 seconds**
- C. 1 day
- D. 0 seconds
- E. 1 hour

Answer: B

NEW QUESTION # 317

A development team is creating a serverless application that uses AWS Lambda functions. The team wants to streamline a testing workflow by sharing test events across multiple developers within the same AWS account. The team wants to ensure all developers can use consistent test events without compromising security.

- A. Configure test events to be shareable. Configure granular IAM permissions to allow the developers to access shared test events.
- B. Store test events in an Amazon DynamoDB table. Create an AWS Lambda function to retrieve shared test events for the developers.
- **C. Export test events as JSON files. Store the files in an Amazon S3 bucket. Configure granular IAM permissions to allow the developers to access the S3 bucket.**
- D. Set up a Git repository to store test events. Provide the developers with access to the repository.

Answer: C

Explanation:

Comprehensive and Detailed Step-by-Step Explanation:

* Option A: Use Amazon S3 for Shared Test Events:

* Storing JSON test event files in an S3 bucket provides a centralized, cost-effective, and highly available solution.

* Granular IAM policies can restrict access to specific developers or roles, ensuring security while maintaining consistency for shared test events.

* This solution has minimal operational overhead and integrates easily with existing workflows.

* Why Other Options Are Incorrect:

* Option B: Using DynamoDB and a Lambda function introduces unnecessary complexity for a relatively simple requirement. S3 provides a simpler and more cost-efficient solution.

* Option C: AWS Lambda test events are not inherently shareable across developers, making this option invalid.

* Option D: Using a Git repository adds operational overhead and requires developers to clone /update repositories for access, which is more cumbersome compared to S3.

NEW QUESTION # 318

A company wants to containerize an existing three-tier web application and deploy it to Amazon ECS Fargate. The application is using session data to keep track of user activities.

Which approach would provide the BEST user experience?

- A. Provision a Redis cluster in Amazon ElastiCache and save the session data in the cluster.
- **B. Enable session stickiness in the existing Network Load Balancer and manage the session data in the container.**
- C. Use an Amazon S3 bucket as data store and save the session data in the bucket.
- D. Create a session table in Amazon Redshift and save the session data in the database table.

Answer: B

NEW QUESTION # 319

A company is using AWS CodeBuild to compile a website from source code stored in AWS CodeCommit. A recent change to the source code has resulted in the CodeBuild project being unable to successfully compile the website.

How should the Developer identify the cause of the failures?

- A. Manually re-run the build process on a local machine so that the output can be visualized.
- B. Use a custom Docker image that includes the AWS X-Ray agent in the AWS CodeBuild project configuration.
- **C. Check the build logs of the failed phase in the last build attempt in the AWS CodeBuild project build history.**
- D. Modify the buildspec.yml file to include steps to send the output of build commands to Amazon CloudWatch.

Answer: C

Q: How can I view past build results?

You can access your past build results through the console, CloudWatch, or the API. The results include outcome (success or failure), build duration, output artifact location, and log location. With the CodeBuild dashboard, you can view metrics to understand build behavior over time. The dashboard displays number of builds attempted, succeeded, and failed, as well as build duration. You can also visit the CloudWatch console to view more detailed build metrics. To learn more about monitoring CodeBuild with CloudWatch, visit our documentation.

Q: How can I debug a past build failure?

You can debug a build by inspecting the detailed logs generated during the build run or you can use CodeBuild Local to locally test and debug your builds.
