Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q65-Q70):

NEW QUESTION # 65

A developer is creating a template that uses AWS CloudFormation to deploy an application. The application is serverless and uses Amazon API Gateway, Amazon DynamoDB, and AWS Lambda.

Which AWS service or tool should the developer use to define serverless resources in YAML?

- A. AWS Elastic Beanstalk
- B. AWS Cloud Development Kit (AWS CDK)
- C. AWS Serverless Application Model (AWS SAM)
- D. CloudFormation serverless intrinsic functions

Answer: C

NEW QUESTION # 66

A developer migrated a legacy application to an AWS Lambda function. The function uses a third-party service to pull data with a series of API calls at the end of each month. The function then processes the data to generate the monthly reports. The function has been working with no issues so far.

The third-party service recently issued a restriction to allow a fixed number of API calls each minute and each day. If the API calls exceed the limit for each minute or each day, then the service will produce errors. The API also provides the minute limit and daily limit in the response header. This restriction might extend the overall process to multiple days because the process is consuming more API calls than the available limit.

What is the MOST operationally efficient way to refactor the serverless application to accommodate this change?

- A. Use Amazon Kinesis Data Firehose to batch the API calls and deliver them to an Amazon S3 bucket with an event notification to invoke the Lambda function.
- B. Use an Amazon Simple Queue Service (Amazon SQS) queue to hold the API calls. Configure the Lambda function to poll the queue within the API threshold limits.
- C. Use an Amazon CloudWatch Logs metric to count the number of API calls. Configure an Amazon CloudWatch alarm that stops the currently running instance of the Lambda function when the metric exceeds the API threshold limits.
- **D. Use an AWS Step Functions state machine to monitor API failures. Use the Wait state to delay calling the Lambda function.**

Answer: D

Explanation:

The solution that will meet the requirements is to use an AWS Step Functions state machine to monitor API failures. Use the Wait state to delay calling the Lambda function. This way, the developer can refactor the serverless application to accommodate the change in a way that is automated and scalable. The developer can use Step Functions to orchestrate the Lambda function and handle any errors or retries. The developer can also use the Wait state to pause the execution for a specified duration or until a specified timestamp, which can help avoid exceeding the API limits. The other options either involve using additional services that are not necessary or appropriate for this scenario, or do not address the issue of API failures.

NEW QUESTION # 67

Regarding Amazon SQS, what happens if there is no activity against a queue for more than 30 consecutive days?

- **A. The queue may be deleted**
- B. Your account will be suspended
- C. Nothing
- D. The queue will be deleted

Answer: A

Explanation:

AWS reserves the right to delete a queue if none of the following requests have been issued against the queue for more than 30 consecutive days:

SendMessage

ReceiveMessage

DeleteMessage

GetQueueAttributes

SetQueueAttributes

You should design your application with this in mind.

NEW QUESTION # 68

A user is planning to host MS SQL on an EBS volume. It was recommended to use the AWS RDS. What advantages will the user have if he uses RDS in comparison to an EBS based DB?

- A. High availability with multi AZs
- **B. Automated backup**
- C. MS SQL is not supported with RDS
- D. Better throughput with PIOPS

Answer: B

Explanation:

Comparing with on-premises or EC2 based MS SQL, RDS provides an automated backup feature. PIOPS is available with both RDS and EBS. However, HA is not available with MS SQL.

NEW QUESTION # 69

A company wants to migrate its web application to AWS and leverage Auto Scaling to handle peak workloads.

The Solutions Architect determined that the best metric for an Auto Scaling event is the number of concurrent users.

Based on this information, what should the Developer use to autoscale based on concurrent users?

- **A. A Custom Amazon CloudWatch metric for concurrent users.**
- B. Amazon CloudFront to leverage AWS Edge Locations
- C. An Amazon Cloudwatch Networkin metric
- D. An Amazon SNS topic to be triggered when a concurrent user threshold is met

Answer: A
