Everybody hopes he or she is a successful man or woman no matter in his or her social life or in his or her career. Thus owning an authorized and significant certificate is very important for them because it proves that he or she boosts practical abilities and profound knowledge in some certain area. Passing AWS-Solutions-Architect-Associate Certification can help they be successful and if you are one of them please buy our AWS-Solutions-Architect-Associate guide torrent because they can help you pass the exam easily and successfully.

We can proudly claim that you can successfully pass the exam just on the condition that you study with our AWS-Solutions-Architect-Associate preparation materials for 20 to 30 hours. And not only you will get the most rewards but also you will get an amazing study experience by our AWS Certified Solutions Architect - Associate (SAA-C02) AWS-Solutions-Architect-Associate Exam Questions. For we have three different versions of our Amazon AWS-Solutions-Architect-Associate study guide, and you will have different feelings if you have a try on them.

Trustworthy AWS-Solutions-Architect-Associate Exam Dumps Pdf & Latest Updated AWS-Solutions-Architect-Associate Prepaway Dumps & High Pass-Rate Amazon AWS Certified Solutions Architect - Associate (SAA-C02)

As we all know, the preparation process for an exam is very laborious and time-consuming. We had to spare time to do other things to prepare for AWS-Solutions-Architect-Associate exam, which delayed a lot of important things. If you happen to be facing this problem, you should choose our AWS-Solutions-Architect-Associate Study Materials. With our study materials, only should you take about 20 - 30 hours to preparation can you attend the exam. The rest of the time you can do anything you want to do to, which can fully reduce your review pressure.

Amazon AWS Certified Solutions Architect - Associate (SAA-C02) Sample Questions (Q205-Q210):

NEW QUESTION # 205

A solutions architect creates a VPC that includes two public subnets and two private subnets. A corporate security mandate requires the solutions architect to launch all Amazon EC2 instances in a private subnet.

However, when the solutions architect launches an EC2 instance that runs a web server on ports 80 and 443 in a private subnet, no external internet traffic can connect to the server.

What should the solutions architect do to resolve this issue?

- A. Launch a NAT gateway in a private subnet. Update the route table for the private subnets to add a default route to the NAT gateway. Attach a public Elastic IP address to the NAT gateway.

- B. Attach the EC2 instance to an Auto Scaling group in a private subnet. Ensure that the DNS record for the website resolves to the Auto Scaling group identifier.
- C. Ensure that the security group that is attached to the EC2 instance allows HTTP traffic on port 80 and HTTPS traffic on port 443. Ensure that the DNS record for the website resolves to the public IP address of the EC2 instance.
- **D. Provision an internet-facing Application Load Balancer (ALB) in a public subnet. Add the EC2 instance to the target group that is associated with the ALB. Ensure that the DNS record for the website resolves to the ALB.**

Answer: D

Explanation:

An Application Load Balancer (ALB) is a type of Elastic Load Balancer (ELB) that distributes incoming application traffic across multiple targets, such as EC2 instances, containers, Lambda functions, and IP addresses, in multiple Availability Zones¹. An ALB can be internet-facing or internal. An internet-facing ALB has a public DNS name that clients can use to send requests over the internet¹. An internal ALB has a private DNS name that clients can use to send requests within a VPC¹. This solution meets the requirements of the question because:

It allows external internet traffic to connect to the web server on ports 80 and 443, as the ALB listens for requests on these ports and forwards them to the EC2 instance in the private subnet¹.

It does not violate the corporate security mandate, as the EC2 instance is launched in a private subnet and does not have a public IP address or a route to an internet gateway².

It reduces the operational overhead, as the ALB is a fully managed service that handles the tasks of load balancing, health checking, scaling, and security¹.

NEW QUESTION # 206

An organization is setting up a highly scalable application using Elastic Beanstalk.

They are using Elastic Load Balancing (ELB) as well as a Virtual Private Cloud (VPC) with public and private subnets. They have the following requirements:

- All the EC2 instances should have a private IP
- All the EC2 instances should receive data via the ELB's.

Which of these will not be needed in this setup?

- A. Create routing rules which will route all inbound traffic from ELB to the EC2 instances.
- **B. Launch the EC2 instances with only the public subnet.**
- C. Configure ELB and NAT as a part of the public subnet only.
- D. Create routing rules which will route all outbound traffic from the EC2 instances through NAT.

Answer: B

Explanation:

The Amazon Virtual Private Cloud (Amazon VPC) allows the user to define a virtual networking environment in a private, isolated section of the Amazon Web Services (AWS) cloud. The user has complete control over the virtual networking environment. If the organization wants the Amazon EC2 instances to have a private IP address, he should create a public and private subnet for VPC in each Availability Zone (this is an AWS Elastic Beanstalk requirement). The organization should add their public resources, such as ELB and NAT to the public subnet, and AWS Elastic Beanstalk will assign them unique elastic IP addresses (a static, public IP address). The organization should launch Amazon EC2 instances in a private subnet so that AWS Elastic Beanstalk assigns them non-routable private IP addresses. Now the organization should configure route tables with the following rules:

* route all inbound traffic from ELB to EC2 instances

* route all outbound traffic from EC2 instances through NAT

NEW QUESTION # 207

A social media company allows users to upload images to its website. The website runs on Amazon EC2 instances. During upload requests, the website resizes the images to a standard size and stores the resized images in Amazon S3. Users are experiencing slow upload requests to the website.

The company needs to reduce coupling within the application and improve website performance. A solutions architect must design the most operationally efficient process for image uploads.

Which combination of actions should the solutions architect take to meet these requirements? (Choose two.)

- **A. Configure S3 Event Notifications to invoke an AWS Lambda function when an image is uploaded. Use the function to**

resize the image

- B. Configure the web server to upload the original images to Amazon S3.
- C. Configure the application to upload images to S3 Glacier.
- D. Create an Amazon EventBridge (Amazon CloudWatch Events) rule that invokes an AWS Lambda function on a schedule to resize uploaded images.
- E. Configure the application to upload images directly from each user's browser to Amazon S3 through the use of a presigned URL.

Answer: A,E

Explanation:

Explanation

Amazon S3 is a highly scalable and durable object storage service that can store and retrieve any amount of data from anywhere on the web¹. Users can configure the application to upload images directly from each user's browser to Amazon S3 through the use of a presigned URL. A presigned URL is a URL that gives access to an object in an S3 bucket for a limited time and with a specific action, such as uploading an object².

Users can generate a presigned URL programmatically using the AWS SDKs or AWS CLI. By using a presigned URL, users can reduce coupling within the application and improve website performance, as they do not need to send the images to the web server first.

AWS Lambda is a serverless compute service that runs code in response to events and automatically manages the underlying compute resources³. Users can configure S3 Event Notifications to invoke an AWS Lambda function when an image is uploaded. S3 Event Notifications is a feature that allows users to receive notifications when certain events happen in an S3 bucket, such as object creation or deletion. Users can configure S3 Event Notifications to invoke a Lambda function that resizes the image and stores it back in the same or a different S3 bucket. This way, users can offload the image resizing task from the web server to Lambda.

NEW QUESTION # 208

A _____ is an individual, system, or application that interacts with AWS programmatically.

- A. AWS Account
- B. user
- C. Role
- D. Group

Answer: B

NEW QUESTION # 209

A company is designing a new web service that will run on Amazon EC2 instances behind an Elastic Load Balancing (ELB) load balancer. However, many of the web service clients can only reach IP addresses authorized on their firewalls.

What should a solutions architect recommend to meet the clients' needs?

- A. An A record in an Amazon Route 53 hosted zone pointing to an Elastic IP address.
- B. An Application Load Balancer with an associated Elastic IP address.
- C. A Network Load Balancer with an associated Elastic IP address.
- D. An EC2 instance with a public IP address running as a proxy in front of the load balancer.

Answer: C

Explanation:

A Network Load Balancer can be assigned one Elastic IP address for each Availability Zone it uses¹. This allows the clients to reach the load balancer using a static IP address that can be authorized on their firewalls. An Application Load Balancer cannot be assigned an Elastic IP address². An A record in an Amazon Route 53 hosted zone pointing to an Elastic IP address would not work because the load balancer would still use its own IP address as the source of the forwarded requests to the web service. An EC2 instance with a public IP address running as a proxy in front of the load balancer would add unnecessary complexity and cost, and would not provide the same scalability and availability as a Network Load Balancer.
