Valid Amazon AWS-Solutions-Associate Exam Papers | AWS-Solutions-

Associate Trustworthy Source

If candidates need to buy the AWS-Solutions-Associate exam dumps for the exam, they must care for the pass rate. The pass rate of our AWS-Solutions-Associate exam dumps is over 98 , and we can ensure that you can pass it. If you have some questions about the AWS-Solutions-Associate Exam Materials, you can consult us. Furthermore, we have the technicians for our website, and they will check network environment safety at times, we offer you a clean and safety online network environment for you.

Amazon AWS Certified Solutions Architect - Associate (SAA-C02) Sample Questions (Q187-Q192):

NEW QUESTION # 187
A company has two applications: a sender application that sends messages with payloads to be processed and a processing application intended to receive the messages with payloads The company wants to implement an AWS service to handle messages between the two applications. The sender application can send about 1,000 messages each hour The messages may take up to 2 days to be processed If the messages fail to process, they must be retained so that they do not impact the processing of any remaining messages Which solution meets these requirements and is the MOST operationally efficient?

- A. Use an Amazon Kinesis data stream to receive the messages from the sender application Integrate the processing application with the Kinesis Client Library (KCL)
- B. Set up an Amazon EC2 instance running a Redis database Configure both applications to use the instance Store, process, and delete the messages, respectively
- C. Integrate the sender and processor applications with an Amazon Simple Queue Service (Amazon SQS) queue. Configure a dead-letter queue to collect the messages that failed to process
- D. Subscribe the processing application to an Amazon Simple Notification Service (Amazon SNS) topic to receive notifications to process Integrate the sender application to write to the SNS topic.

Answer: C

NEW QUESTION # 188
A company is designing a website that will be hosted on Amazon S3.
How should users be prevented from linking directly to the assets in the S3 bucket?

- A. Create a static website, then configure an Amazon Route 53 record set with an alias pointing to the static website. Provide this URL to users.
- B. Create a static website, then update the bucket policy to require users to access the resources with the static website URL.
- C. Create an Amazon CloudFront distribution with an AWS WAF web ACL that permits access to the origin server through the distribution only.
- D. Create an Amazon CloudFront distribution with an Origin Access Identity (OAI) and update the bucket policy to grant permission to the OAI only.

Answer: D

NEW QUESTION # 189
You are running a mobile media application and are considering API Gateway for the client entry point. What benefits would this provide? Choose 2 answers

- A. Caching API responses
- B. IP blacklisting
- C. Load balancing
- D. Throttling traffic
- E. Intrusion prevention

Answer: A,D

Explanation:
Explanation: API Logging, Caching, Throttling, Bursting and MonitoringInstead of invoking the backend API for every client call, developers can configure caching which will improve performance. Cache settings allow developers to control the way the cache key is built and the time-to-live (TTL) of the data stored for each method. The management API can be invoked to invalidate the

cache. The pricing for this feature is based on the size of the cache.

Developers need to protect their backend APIs from deliberate misuse. They may also want to restrict the rate at which the API is invoked. Through throttling, it is possible to set a rate limit of API requests to avoid sudden spikes. API Gateway can also be configured to handle bursts of API calls for specific scenarios. Clients can include automatic retry logic when they receive a 429 HTTP response as a result of throttling. With the right configuration of cache and throttling, developers can increase the performance while securing the backend API.

Since API Gateway is a crucial element of an application, it needs to be monitored for uptime. For custom gateways, administrators need to configure native monitoring combined with agents. Amazon API Gateway integrates with CloudWatch, the one-stop monitoring service for all AWS services. By configuring an IAM role that has write access to CloudWatch logs, API Gateway can be monitored for a variety of metrics.

Configuring Caching, Logging, Monitoring and Throttling

NEW QUESTION # 190

You have an EC2 Security Group with several running EC2 instances. You change the Security Group rules to allow inbound traffic on a new port and protocol, and launch several new instances in the same Security Group. The new rules apply:

- A. Immediately to all instances in the security group.
- B. Immediately to the new instances only.
- C. To all instances, but it may take several minutes for old instances to see the changes.
- D. Immediately to the new instances, but old instances must be stopped and restarted before the new rules apply.

Answer: A

NEW QUESTION # 191

A Solutions Architect is redesigning an image-viewing and messaging platform to be delivered as SaaS.

Currently, there is a farm of virtual desktop infrastructure (VDI) that runs a desktop image-viewing application and a desktop messaging application. Both applications use a shared database to manage user accounts and sharing. Users log in from a web portal that launches the applications and streams the view of the application on the user's machine. The Development Operations team wants to move away from using VDI and wants to rewrite the application.

What is the MOST cost-effective architecture that offers both security and ease of management?

- A. Run a website as an AWS Elastic Beanstalk application, storing the images in Amazon S3, and using an Amazon RDS database for user accounts and sharing. Create AWS CloudFormation templates to launch the application and perform blue/green deployments.
- B. Run a website from an Amazon S3 bucket with a separate S3 bucket for images and messaging data.
  Call AWS Lambda functions from embedded JavaScript to manage the dynamic content, and use Amazon Cognito for user and sharing management.
- C. Run a website from an Amazon S3 bucket that authorizes Amazon AppStream to stream applications for a combined image viewer and messenger that stores images in Amazon S3. Have the website use an Amazon RDS database for user accounts and sharing.

- D. Run a website from Amazon EC2 Linux servers, storing the images in Amazon S3, and use Amazon Cognito for user accounts and sharing. Create AWS CloudFormation templates to launch the application by using EC2 user data to install and configure the application.

Answer: A

NEW QUESTION # 192
