Axis Network Video Exam Sample Questions (Q280-Q285):

NEW QUESTION # 280

A customer has strict requirements of 30 fps for recorded video. Which encoder choice would they select if they wanted three streams, per every one encoded channel, of D1 resolution video run at 30 fps in H.264?

- A. AXISP7210
- **B. AXISP7214**
- C. AXISQ7406
- D. AXISM7210

Answer: B

Explanation:

The AXISP7214 encoder is designed to support multiple video streams per channel and is capable of delivering high frame rates and resolutions, such as D1 resolution at 30 fps in H.264 format. This encoder can handle the strict requirements of delivering 30 fps for recorded video while managing three streams per channel. Axis Network Video documentation specifies that the AXISP7214 is optimized for high-performance video encoding, making it suitable for applications demanding multiple streams and high frame rates.

NEW QUESTION # 281

Which network features are usually combined to prevent access to the surveillance network?

- A. Router port forwarding and IP subnets
- **B. IP subnets and VLANs**
- C. Router port forwarding and VLANs
- D. IEEE 802.3ad link aggregation and HTTPS encryption

Answer: B

Explanation:

IP subnets and VLANs are commonly used network features to prevent unauthorized access to the surveillance network. By segmenting the network using IP subnets, different portions of the network can be isolated, reducing the risk of cross-network attacks. VLANs (Virtual Local Area Networks) further enhance security by creating separate broadcast domains within the same physical network, thereby isolating surveillance devices from other network traffic and improving overall network security and performance.

NEW QUESTION # 282

statement best describes how an ACAP works?

- A. The analytic is run on a remote server
- **B. The analytic is run on the device**
- C. The analytic is run on a cloud server
- D. The analytic is run on a local server

Answer: B

Explanation:

ACAP (Axis Camera Application Platform) analytics run directly on the device. This means that the processing and analysis of data occur on the camera itself, rather than on a separate server or in the cloud.

Running analytics on the device reduces the need for additional hardware and network bandwidth, and it allows for faster decision-

making and real-time alerts. This information is confirmed by Axis Communications' documentation on ACAP.

NEW QUESTION # 283

Which of these apertures gathers the most light on the image sensor?

- A. f/3.6
- B. f/5.6
- C. f/2.0
- D. f/8.0

Answer: C

Explanation:

"A lens with a lower f-number (larger aperture) allows more light to reach the image sensor, which is beneficial for low-light performance. For example, an aperture of f/2.0 lets in significantly more light than f/3.

6, f/5.6, or f/8.0."

- Axis Communications Academy, Network Video Fundamentals, 2022

"The amount of light entering the camera is inversely related to the f-number. The lower the f-number, the wider the aperture, and thus, more light is gathered by the image sensor."

- Axis Communications, Lens Guide

NEW QUESTION # 284

Which statement is true for broadcast network traffic?

- A. Broadcast is a method for sending video to many recipients over the internet even though their bandwidths vary
- B. Broadcast data packet length is longer than normal Ethernet packets, to accommodate a full video frame
- C. Broadcast is not practical for network video transmission, since packets are transmitted to every device on the network
- D. Broadcast is designed to enable optimized video transmission, since it tolerates network dropouts

Answer: C
