New AZ-400 Valid Braindumps Book 100% Pass | Valid AZ-400: Designing and Implementing Microsoft DevOps Solutions 100% Pass

A steadily rising competition has been noted in the tech field. Countless candidates around the globe aspire to be Designing and Implementing Microsoft DevOps Solutions in this field. Microsoft AZ-400 stand out from the rest of the Microsoft professionals. Once you become Microsoft certified, a whole new scope opens up to you and you are immediately hired by reputed firms. Even though the Designing and Implementing Microsoft DevOps Solutions boosts your career options, you have to pass the AZ-400 Exam. This Designing and Implementing Microsoft DevOps Solutions exam serves to filter out the capable from incapable candidates.

Microsoft Designing and Implementing Microsoft DevOps Solutions Sample Questions (Q494-Q499):

NEW QUESTION # 494

You are implementing a package management solution for a Node.js application by using Azure Artifacts.

You need to configure the development environment to connect to the package repository. The solution must minimize the likelihood that credentials will be leaked.

Which file should you use to configure each connection? To answer, drag the appropriate files to the correct connections. Each file may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content NOTE: Each correct selection is worth one point.

Files

- The .npmrc file in the project
- The .npmrc file in the user's home folder
- The Package.json file in the project
- The Project.json file in the project

Answer Area

Registry information:

Credentials:

File

File

Answer:

Explanation:

/azrepos

feedback	https://dev.azure.com/contoso/contoso-app
signin	https://dev.azure.com/contoso/contoso-app/core-api
subscribe	https://dev.azure.com/contoso/contoso-app/core-db
subscriptions	https://dev.azure.com/contoso/contoso-app/core-spa

Explanation

Feed registry information: The .npmrc file in the project

Credentials: The .npmrc file in the user's home folder

All Azure Artifacts feeds require authentication, so you'll need to store credentials for the feed before you can install or publish packages. npm uses .npmrc configuration files to store feed URLs and credentials. Azure DevOps Services recommends using two .npmrc files.

Feed registry information: The .npmrc file in the project

One .npmrc should live at the root of your git repo adjacent to your project's package.json. It should contain a "registry" line for your feed and it should not contain credentials since it will be checked into git.

Credentials: The .npmrc file in the user's home folder

On your development machine, you will also have a .npmrc in \$home for Linux or Mac systems or

\$env.HOME for win systems. This .npmrc should contain credentials for all of the registries that you need to connect to. The NPM client will look at your project's .npmrc, discover the registry, and fetch matching credentials from \$home/.npmrc or \$env.HOME/.npmrc.

NEW QUESTION # 495

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You plan to create a release pipeline that will deploy Azure resources by using Azure Resource Manager templates. The release pipeline will create the following resources:

- * Two resource groups
- * Four Azure virtual machines in one resource group
- * Two Azure SQL databases in other resource group

You need to recommend a solution to deploy the resources.

Solution: Create two standalone templates, each of which will deploy the resources in its respective group.

Does this meet the goal?

- A. No
- B. Yes

Answer: A

Explanation:

Use a main template and two linked templates.

References:

<https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-linked-templates>

NEW QUESTION # 496

Your company builds a multi tier web application.

>You use Azure DevOps and host the production application on Azure virtual machines.

Your team prepares an Azure Resource Manager template of the virtual machine that you will use to test new features.

You need to create a staging environment in Azure that meets the following requirements:

* Minimizes the cost of Azure hosting

* Provisions the virtual machines automatically

* Use* the custom Azure Resource Manager template to provision the virtual machines What should you do?

- A. In Azure DevOps, configure new tasks in the release pipeline to deploy to Azure Cloud Services.
- **B. In Azure DevOps, configure new tasks in the release pipeline to create and delete the virtual machines in Azure DevTest Labs.**
- C. In Azure Cloud Shell, run Azure CLI commands to create and delete the new virtual machines in a staging resource group.
- D. From Azure Cloud Shell, run Azure PowerShell commands to create and delete the new virtual machines in a staging resource group.

Answer: B

Explanation:

You can use the Azure DevTest Labs Tasks extension that's installed in Azure DevOps to easily integrate your CI/CD build-and-release pipeline with Azure DevTest Labs. The extension installs three tasks:

Create a VM

Create a custom image from a VM

Delete a VM

The process makes it easy to, for example, quickly deploy a "golden image" for a specific test task and then delete it when the test is finished.

NEW QUESTION # 497

You need to use Azure Automation Sure Configuration to manage the ongoing consistency of virtual machine configurations.

Which five actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

NOTE: More than one order of answer choices is correct. You will receive credit for any of the orders you select.

Actions

Onboard the virtual machines to Azure Automation State Configuration.

Check the compliance status of the node.

Create a management group.

Assign the node configuration.

Compile a configuration into a node configuration.

Upload a configuration to Azure Automation State Configuration.

Assign tags to the virtual machines.

Answer Area

Answer:

Explanation:

ACTIONS

Onboard the virtual machines to Azure Automation State Configuration.

Check the compliance status of the node.

Create a management group.

Assign the node configuration.

Compile a configuration into a node configuration.

Upload a configuration to Azure Automation State Configuration.

Assign tags to the virtual machines.

Explanation

Answer Area

Assign the node configuration.

Upload a configuration to Azure Automation State Configuration.

Compile a configuration into a node configuration.

Onboard the virtual machines to Azure Automation State Configuration.

Check the compliance status of the node.

Step 1: Assign the node configuration.

You create a simple DSC configuration that ensures either the presence or absence of the Web-Server Windows Feature (IIS), depending on how you assign nodes.

Step 2: Upload a configuration to Azure Automation State Configuration.

You import the configuration into the Automation account.

Step 3: Compiling a configuration into a node configuration

Compiling a configuration in Azure Automation

Before you can apply a desired state to a node, a DSC configuration defining that state must be compiled into one or more node configurations (MOF document), and placed on the Automation DSC Pull Server.

Step 4: Onboard the virtual machines to Azure State Configuration

Onboarding an Azure VM for management with Azure Automation State Configuration Step 5: Check the compliance status of the node.

Viewing reports for managed nodes. Each time Azure Automation State Configuration performs a consistency check on a managed node, the node sends a status report back to the pull server. You can view these reports on the page for that node.

On the blade for an individual report, you can see the following status information for the corresponding consistency check:

The report status - whether the node is "Compliant", the configuration "Failed", or the node is "Not Compliant" (when the node is in ApplyandMonitor mode and the machine is not in the desired state).

NEW QUESTION # 498

You are building an application that has the following assets:

- * Source code
- * Logs from automated tests and builds
- * Large and frequently updated binary assets
- * A common library used by multiple applications

Where should you store each asset? To answer, drag the appropriate Azure services to the correct assets. Each service may be used once. You may need to drag the split bar between panes or scroll to view content.

NOTE: Each correct selection is worth one point.

Azure Services

- Azure Artifacts
- Azure Pipelines
- Azure Repos
- Azure Storage
- Azure Test Plans

Answer Area

Source code:

A common library used by multiple applications:

Logs from automated tests and builds:

Large and frequently updated binary assets:

	Azure Service
	Azure Service
	Azure Service
	Azure Service
	Azure Service

Answer:

Explanation:

Explanation

Box 1: Azure Repos

Box 2: Azure Artifacts

Use Azure Artifacts to create, host, and share packages with your team.

Box 3: Azure Pipelines

In the pipeline view you can see all the stages and associated tests. The view provides a summary of the test results Box 4: Azure Storage Reference:
