We believe that the study materials will keep the top selling products. We sincerely hope that you can pay more attention to our Cloud-Deployment-and-Operations study questions.

## WGU Cloud Deployment and Operations Sample Questions (Q23-Q28):

### NEW QUESTION # 23

(Which solution is used to protect a server from Layer 7 attacks?)

- A. Shield
- **B. WAF**
- C. KMS key rotation
- D. CloudWatch

**Answer: B**

Explanation:

AWS WAF (Web Application Firewall) is used to protect a server from Layer 7 (application layer) attacks, such as SQL injection or cross-site scripting, by filtering HTTP/HTTPS traffic based on defined rules. The WGU Cloud Deployment and Operations Study Guide (Section 6.2, AWS WAF) states, "WAF protects web applications at Layer 7 by inspecting and blocking malicious requests, such as those involving SQL injection or XSS, when integrated with ALB or CloudFront." Shield protects against DDoS (Layer 3/4), CloudWatch monitors metrics, and KMS key rotation manages encryption, none of which address Layer 7 attacks.

### NEW QUESTION # 24

(Which feature should be configured to deploy a static website to AWS?)

- A. S3 Versioning
- B. RDS Proxy
- **C. Bucket properties**
- D. CloudTrail events

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To deploy a static website to AWS, the bucket properties of an Amazon S3 bucket should be configured, specifically enabling static website hosting. This involves setting the bucket policy to allow public read access and configuring the index and error documents. The WGU Cloud Deployment and Operations Study Guide (Section 2.1, S3 Static Website Hosting) states, "Configuring bucket properties for static website hosting in S3 involves enabling the website endpoint, setting an index document (e.g., index.html), and applying a bucket policy for public access, making it suitable for hosting static content." RDS Proxy, S3 Versioning, and CloudTrail events are not relevant to this use case.

### NEW QUESTION # 25

(A company manages a containerized application by manually deploying AWS compute instances. Which solution should be used to optimize the cost of the application?)

- A. RDS
- B. Aurora
- **C. Fargate**
- D. EFS

**Answer: C**

Explanation:

AWS Fargate should be used to optimize the cost of a containerized application by eliminating the need for manual instance management, as it provides serverless container orchestration that automatically scales and charges only for resource usage. The WGU Cloud Deployment and Operations Study Guide (Section 7.5, Fargate) states, "Fargate optimizes costs for containerized applications by removing the overhead of managing EC2 instances, scaling automatically, and billing based on vCPU and memory usage, reducing manual deployment expenses." Aurora, RDS, and EFS are database or storage solutions not designed for container cost optimization.

### NEW QUESTION # 26

(A company configures the CloudFront caching TTL to the following settings: Min: 0, Max: 172800. An administrator updates the Cache-Control setting to 432000. However, objects are only cached for 48 hours. What is required to ensure objects are cached for up to 120 hours?)

- A. Configure the expiration setting for 172800
- B. Configure the Min setting for 432000
- **C. Configure the Max setting for 432000**
- D. Configure the Cache-Control setting for 172800

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

In Amazon CloudFront, the caching TTL is controlled by the minimum and maximum TTL settings, with the maximum TTL (in seconds) capping the cache duration. The current Max TTL is 172800 seconds (48 hours), and the Cache-Control setting of 432000 seconds (120 hours) is ignored because it exceeds the Max TTL. To cache objects for up to 120 hours, the Max setting must be configured to 432000 seconds. The WGU Cloud Deployment and Operations Study Guide (Section 4.4, CloudFront Caching) states, "The maximum TTL in CloudFront settings (e.g., 172800 seconds) overrides any higher Cache-Control value; to allow 120 hours (432000 seconds), the Max TTL must be set accordingly." Adjusting Min, expiration, or Cache-Control alone does not resolve this.

### NEW QUESTION # 27

(An administrator is unable to make an AMI public. What is the cause?)

- A. Legacy BIOS boot mode is used
- B. Paravirtual virtualization is used
- **C. Boot volume is encrypted**
- D. Bookmark is absent

**Answer: C**

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

The inability to make an AMI public is caused by an encrypted boot volume. AWS does not allow AMIs with encrypted EBS snapshots to be shared publicly due to security constraints; sharing is limited to specific AWS accounts. The WGU Cloud Deployment and Operations Study Guide (Section 6.3, AMI Management) states, "An AMI cannot be made public if its boot volume is encrypted; encryption restricts sharing to authorized accounts only, requiring decryption keys to be managed separately." Legacy BIOS, paravirtual virtualization, and the absence of a bookmark do not impact AMI sharing.
