## Salesforce-MuleSoft-Developer-II Exam Assessment - Guaranteed Salesforce-MuleSoft-Developer-II Questions Answers

If you are going to purchasing the Salesforce-MuleSoft-Developer-II training materials, and want to get a general idea of what our product about, you can try the free demo of our website. Once you have decide to buy the Salesforce-MuleSoft-Developer-II training materials, if you have some questions, you can contact with our service, and we will give you suggestions and some necessary instruction. You will get the Salesforce-MuleSoft-Developer-II Exam Dumps within ten minutes. And if you didn't receive it, you can notify us through live chat or email, we will settle it for you.

### Salesforce Certified MuleSoft Developer II Sample Questions (Q24-Q29):

#### NEW QUESTION # 24

Refer to the exhibit.

A Mule application pom.xml configures the Maven Resources plugin to exclude parsing binary files in the project's src/main/resources/certs directory.

Which configuration of this plugin achieves a successful build?

- A.
- B.
- C.
- D.

**Answer: B**

Explanation:

To configure the Maven Resources plugin to exclude parsing binary files in the project's src/main/resources/certs directory, option C should be used. This option specifies that any files with .cer or .jks extensions under the certs directory should be excluded from filtering. Filtering is a process of replacing placeholders with actual values in resource files during the build process. Binary files should not be filtered because they may become corrupted or unusable. Reference: <https://maven.apache.org/plugins/maven-resources-plugin/examples/filter.html> <https://maven.apache.org/plugins/maven-resources-plugin/examples/include-exclude.html>

#### NEW QUESTION # 25

A developer is working on a project that requires encrypting all data before sending it to a backend application. To accomplish this, the developer will use PGP encryption in the Mule 4 Cryptography module.

What is required to encrypt the data before sending it to the backend application?

- A. The application needs the private key from the backend service to encrypt the data
- **B. The application needs the public key from the backend service to encrypt the data**
- C. The application needs to configure HTTPS TLS context information to encrypt the data
- D. The application needs to both the private and public keys to encrypt the data

**Answer: B**

Explanation:

To encrypt the data before sending it to the backend application using PGP encryption, the application needs the public key from the backend service. PGP encryption uses a public-key cryptography system, which means that each party has a pair of keys: a public key and a private key. The public key is used to encrypt data, and the private key is used to decrypt data. Therefore, to encrypt data for a specific recipient (the backend service), the application needs to use the recipient's public key. The recipient can then use its own private key to decrypt the data. Reference: <https://docs.mulesoft.com/mule-runtime/4.3/cryptography-pgp>

#### NEW QUESTION # 26

A mule application exposes an API for creating payments. An Operations team wants to ensure that the Payment API is up and running at all times in production.

Which approach should be used to test that the payment API is working in production?

- A. Monitor the Payment API directly sending real customer payment data
- B. Configure the application to send health data to an external system
- **C. Create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API**
- D. Create a health check endpoint that reuses the same port number and HTTP Listener configuration as the API itself

**Answer: C**

Explanation:

To test that the payment API is working in production, the developer should create a health check endpoint that listens on a separate port and uses a separate HTTP Listener configuration from the API. This way, the developer can isolate the health check endpoint from the API traffic and avoid affecting the performance or availability of the API. The health check endpoint should return a simple response that indicates the status of the API, such as OK or ERROR. Reference: <https://docs.mulesoft.com/api-functional-monitoring/afm-create-monitor#create-a-monitor>

#### NEW QUESTION # 27

Refer to the exhibit.

What required changes can be made to give a partial successful response in case the United Airlines API returns with a timeout?

- A. Add Flow Reference components inside a Try scope.  
Set the payload to a default value" insider the error handler using the ON Error Continue scope
- B. Add Flow Reference components inside a Try scope  
Set the payload to a default value " inside the error handler using the On Error Propagate scope
- C. Add a Scatter-gather component inside a Try scope.  
Set the payload to a default value 'Error' inside the error handler using the On Error Propagate scope.
- **D. Add a Scatter-Gather component inside a Try scope.**

Set the payload to a default value 'Error' inside the error handler using the On Error Continue scope.

**Answer: D**

Explanation:

To give a partial successful response in case the United Airlines API returns with a timeout, the developer should add a Scatter-Gather component inside a Try scope, and set the payload to a default value 'Error' inside the error handler using the On Error Continue scope. A Scatter-Gather component allows sending multiple requests concurrently and aggregating the responses into an array. A Try scope allows handling errors that occur within it using an error handler. An On Error Continue scope allows continuing the flow execution after handling an error. Therefore, by using these components, the developer can send requests to both APIs in parallel, handle any timeout errors from United Airlines API, and return a partial response with a default value for that API.

Reference: <https://docs.mulesoft.com/mule-runtime/4.3/scatter-gather-concept> <https://docs.mulesoft.com/mule-runtime/4.3/try-scope-concept> <https://docs.mulesoft.com/mule-runtime/4.3/on-error-continue-concept>

### NEW QUESTION # 28

A Mule application for processing orders must log the order ID for every log message output. What is a best practice to enrich every log message with the order ID?

- A. Create a custom XML SDK component to wrap the logger processor and automatically add the order ID within the connector
- **B. Use the Tracing module to set logging variables with a Mapped Diagnostic Context**
- C. Use flow variables within every logger processor to log the order ID
- D. Set a flow variable and edit the log4/2.xml file to output the variable as part of the message pattern

**Answer: B**

Explanation:

To enrich every log message with the order ID, the developer should use the Tracing module to set logging variables with a Mapped Diagnostic Context (MDC). The Tracing module allows adding custom key-value pairs to log messages using MDC variables. The developer can use Set Logging Variables operation to set the order ID as an MDC variable and then use it in any logger processor within the same thread or event. Reference: <https://docs.mulesoft.com/tracing-module/1.0/tracing-module-reference#set-logging-variables>

### NEW QUESTION # 29

.....

Sometime, most candidates have to attend an exam, they may feel nervous and don't know what to do. If you happen to be one of them, our Salesforce-MuleSoft-Developer-II learning materials will greatly reduce your burden and improve your possibility of passing the exam. Our advantages of time-saving and efficient can make you no longer be afraid of the Salesforce-MuleSoft-Developer-II Exam, and you will find more about the benefits of our Salesforce-MuleSoft-Developer-II exam questions later on.
