You totally can afford for our Development-Lifecycle-and-Deployment-Architect Preparation engine. And we give some discounts from time to time, so you can buy at a more favorable price.

Salesforce Certified Development Lifecycle and Deployment Architect Sample Questions (Q200-Q205):

NEW QUESTION # 200

Ursa Major Solar (UMS) has used Aura components significantly in its Salesforce application development. UMS has established a robust test framework and the development team follows the Salesforce recommended testing practices. UMS team uses Salesforce's test tool To check for common accessibility issues.

In which two environments the UMS team can call Aura accessibility tests?

Choose 2 answers

- A. AuraDriver Test
- B. ACCTEST
- C. WebDriver Test
- D. JSTEST

Answer: C,D

Explanation:

Explanation

Aura accessibility tests can be called in JSTEST and WebDriver Test environments. JSTEST is a JavaScript testing framework that runs on Node.js and can be used to test Aura components. WebDriver Test is a Selenium-based testing framework that can be used to test the user interface and accessibility of Aura components. ACCTEST and AuraDriver Test are not valid environments for calling Aura accessibility tests.

NEW QUESTION # 201

Universal Containers has discovered a Sev0 defect in production. Tens of thousands of records will be created with incorrect data in minutes, producing significant brand damage as a consequence. The Salesforce administrator has suggested that the defective text field be replaced with a new picklist field directly in production. The page layout will be modified so that the text-field is removed and the new picklist field added.

What should the Salesforce architect advise?

- A. Explain that only developers are certified to make changes directly in production.
- B. Pair with the administrator, and review each change as it happens
- C. Call the security team and begin organizing a penetration test.
- D. Deny the suggestion and explain to everyone that the risk is too high and the next release window is on the weekend.

Answer: B

NEW QUESTION # 202

Universal Containers (UC) has created a custom REST web service. This web service receives Orders and Order Line Items data from an external endpoint and runs business logic and validations on it before inserting it into the database. UC is expecting to receive more than 100K orders a day and each order can have up to 10- line items. Each inbound request will contain only one

order and its corresponding line items.

What two testing types should an architect recommend to ensure users don't face platform slowdowns during peak business hours?
Choose 2 answers

- **A. Stress Testing**
- B. Unit Testing
- **C. Performance Testing**
- D. Load Testing

Answer: A,C

Explanation:

Two testing types that an architect should recommend to ensure users don't face platform slowdowns during peak business hours are: stress testing and performance testing. Stress testing is the process of testing the system under extreme load conditions, such as a large number of concurrent requests, to determine its breaking point and identify any potential bottlenecks or failures. Performance testing is the process of testing the system under normal or expected load conditions, such as the average number of requests per day, to measure its response time, throughput, and resource utilization. These testing types can help ensure that the web service can handle the expected volume and frequency of requests, and that it meets the performance and reliability requirements. Unit testing is not a testing type that an architect should recommend for this scenario, as it is the process of testing individual units of code, such as methods or classes, to verify their functionality and logic. Load testing is also not a testing type that an architect should recommend for this scenario, as it is the process of testing the system under a specific load condition, such as a fixed number of requests, to evaluate its behavior and performance. See Testing RESTful Web Services for more details.

NEW QUESTION # 203

A year has passed since a project has gone live and a developer is looking to make an update to an existing Apex class, but is unsure of its purpose. What artifact from the original project should be leveraged to determine the purpose of the class?

- A. Test Sign Off Document
- **B. Requirements Traceability Matrix**
- C. Test Execution Plan
- D. User Acceptance Test Scripts

Answer: B

Explanation:

Explanation

A Requirements Traceability Matrix is a document that links requirements to their sources and test cases, as well as the components that implement them. By using this artifact, a developer can easily find the purpose of an Apex class and the requirement it fulfills.

NEW QUESTION # 204

UniversalContainers CUC) has multi-cloud architecture in a single org. The Sales Cloud dev team is working in a Dev Pro sandbox (DevPro1) of delivering a release in three months. The business requirements from Service Cloud warrant a quicker release in four weeks, but need part of the Sales Cloud work that is completed in DevPro1. The decision of using a separate Dev Pro sandbox (DevPro2) is still pending. The DevPro1 was upgraded to preview for next Salesforce major release two weeks ago. What should an Architect recommend?

- A. Clone the DevPro1 sandbox and name it DevPro2 for the second work stream to work on the Service Cloud requirements.
- B. Push back on the requirements because adding another work stream will bring some risks with it.
- C. Ask the second work stream team to work on the same DevPro1 sandbox.
- **D. DevPro1 cannot be cloned because it is on a different version from Production. Just create a new DevPro2, and migrate metadata from DevPro1.**

Answer: D

Explanation:

DevPro1 cannot be cloned because it is on a different version from Production, as it was upgraded to preview for the next Salesforce major release two weeks ago. Therefore, the architect should recommend creating a new DevPro2, and migrating metadata from DevPro1. This way, the second work stream can work on the Service Cloud requirements in a separate sandbox,

without affecting the Sales Cloud dev team. Asking the second work stream team to work on the same DevPro1 sandbox would create conflicts and dependencies between the two teams, and would not allow them to release at different times. Pushing back on the requirements because adding another work stream will bring some risks with it would not be a good option, as the business needs might be urgent and important.

NEW QUESTION # 205

.....

Our Development-Lifecycle-and-Deployment-Architect exam torrents can pacify your worries and even help you successfully pass it. The shortage of necessary knowledge of the exam may make you waver, while the abundance of our Development-Lifecycle-and-Deployment-Architect study materials can boost your confidence increasingly. Besides, considering the current status of practice materials market based on exam candidates' demand, we only add concentrated points into our Development-Lifecycle-and-Deployment-Architect Exam tool to save time and cost for you.
