The section also introduces Cisco's campus network devices, data center switches, UCS servers, and collaboration devices, describing their roles and functions in the network.
Thema 2	• Cisco UCS and Data Center Architecture: This section of the exam measures the skills of a Data Center Engineer and introduces Cisco's UCS and data center solutions. It explains the devices found in a data center, including switches, UCS servers, and director switches, and describes different server deployment models. Students will also learn about virtualization components like virtual machines, hypervisors, cloud computing concepts, and deployment models. The section covers how Cisco UCS devices fit into campus networks, edge locations, and data centers, and explains the key components and connections used in UCS architecture.

Thema 3	• Cisco Hardware Replacement: This section of the exam measures the skills of a Technical Support Engineer and teaches how to safely and correctly replace Cisco hardware. It explains safety procedures such as creating safe work zones and handling electrostatic discharge. Students learn the step-by-step processes to replace a wide range of Cisco devices, from switches and routers to firewalls, UCS servers, and collaboration endpoints. It also covers configuring Cisco NX-OS software, including understanding operating modes, boot procedures, and password recovery, and introduces Cisco collaboration endpoint solutions like IP phones and video systems.
Thema 4	• Common Service Tasks and Tools: This section of the exam measures the skills of a Technical Support Engineer and focuses on tasks commonly needed to manage Cisco devices. It explains how devices boot up, introduces common Cisco IOS commands, and identifies tools for file management. It shows how to confirm physical connections, remotely access devices, and connect to the console port. It also covers how to capture the status of a device, recover passwords, and replace devices by using proper tools. Students are also taught how to find serial numbers on Cisco equipment to assist with support and maintenance activities.

Cisco Supporting Cisco Devices for Field Technicians 800-150 Prüfungsfragen mit Lösungen (Q53-Q58):

53. Frage

How must the power to a system with dual power supplies on a Cisco Nexus switch be connected?

- **A. Connect each power supply to a separate power source.**
- B. Connect both power supplies to a power distribution unit with built-in redundancy.
- C. Connect both power supplies to a single power source.
- D. Connect the primary power supply to the main source and the secondary to a backup generator.

Antwort: A

Begründung:

In a Cisco Nexus switch with dual power supplies, the recommended method is to connect each power supply to a separate power source (Option C). This ensures power redundancy and fault tolerance.

If one power source fails (e.g., due to a power outage or circuit failure), the switch can continue operating uninterrupted using the second power source. Connecting both to a single source (Option D) defeats the purpose of redundancy.

54. Frage

Which key sequence is used to enter the boot prompt mode when the Cisco NX-OS Software begins the software boot process?

- **A. Ctrl-C**
- B. Ctrl-I
- C. Ctrl-Z
- D. Ctrl-X

Antwort: A

Begründung:

During the boot process of Cisco devices running NX-OS, pressing Ctrl-C at the right time will interrupt the boot sequence and bring the system to the boot loader or ROMmon mode (commonly referred to as the boot prompt).

This allows a technician to perform low-level operations such as recovering passwords, specifying an alternate boot image, or performing diagnostics.

Other options (Ctrl-X, Ctrl-Z, Ctrl-1) are not used for interrupting the boot process in Cisco NX-OS platforms.

55. Frage

Refer to the exhibit.

```
Router# [REDACTED]
NAME: "Chassis", DESCR: "Cisco ISR4451-X/K9"
PID: ISR4451-X/K9, VID: V01, SN: FCW2134L0SH
```

Refer to the exhibit. Which CLI show command identifies the serial number on a router?

- A. show inventory
- B. show version
- C. show idprom
- D. show platform

Antwort: A

Begründung:

The show inventory command is used on Cisco devices to display detailed information about the hardware components installed, including:

Product Identifier (PID)

Serial Number (SN)

Description of the component

In the exhibit, the output clearly shows:

NAME: "Chassis", DESCR: "Cisco ISR4451-X/K9"

PID: ISR4451-X/K9, VID: V01, SN: FCW2134L0SH

This confirms that show inventory is the correct command to retrieve the serial number and hardware inventory details.

show version provides some system information and sometimes includes serial numbers, but it's not as reliable or detailed for component-level hardware info.

show idprom is not commonly used and not supported on all platforms.

show platform provides platform-specific info but not typically the serial number.

56. Frage

How must the power to a system with dual power supplies on a Cisco Nexus switch be connected?

- A. Connect each power supply to a separate power source.
- B. Connect both power supplies to a power distribution unit with built-in redundancy.
- C. Connect both power supplies to a single power source.
- D. Connect the primary power supply to the main source and the secondary to a backup generator.

Antwort: A

Begründung:

In a Cisco Nexus switch with dual power supplies, the recommended method is to connect each power supply to a separate power source (Option C). This ensures power redundancy and fault tolerance.

If one power source fails (e.g., due to a power outage or circuit failure), the switch can continue operating uninterrupted using the second power source. Connecting both to a single source (Option D) defeats the purpose of redundancy.

57. Frage

Drag and drop the network connectivity and management tools used to ensure connectivity from the left onto the description on the right.

SSH	sends ICMP echo request packets to verify connectivity
Telnet	allows virtual terminal connections with unencrypted traffic
PING	provides secure, encrypted remote access to network devices
IP address configuration	requires the PC and Cisco device to be in the same subnet for direct connection

Antwort:

Begründung:

SSH	PING
Telnet	Telnet
PING	SSH
IP address configuration	IP address configuration

Explanation:

* PING# Sends ICMP echo request packets to verify connectivity

* Telnet# Allows virtual terminal connections with unencrypted traffic

* SSH# Provides secure, encrypted remote access to network devices

* IP address configuration# Requires the PC and Cisco device to be in the same subnet for direct connection These tools and their functions are covered under "Device Configuration and Verification" in the FLDTEC course:

PING: Utilized to test basic network connectivity using ICMP echo request/reply messages. It confirms whether a device is reachable and measures the round-trip time.

Telnet: A protocol that allows for remote device access but transmits data in plaintext, which makes it insecure. It's typically disabled by default on modern Cisco devices due to security concerns.

SSH (Secure Shell): Replaces Telnet as the preferred method for secure CLI access. It encrypts the session, protecting sensitive information such as login credentials.

IP Address Configuration: For direct device access via the same local network, both the PC and the Cisco device must be in the same subnet. This allows the use of tools like browser-based GUIs or terminal emulators when connecting directly.
