# Free PDF Quiz CheckPoint - 156-587 Accurate Valid Exam Experience

BTW, DOWNLOAD part of FreeCram 156-587 dumps from Cloud Storage: https://drive.google.com/open?id=1KAZl0E-JozhLkhlww1pzSM_CfWBcLj-1

Passing the 156-587 exam rests squarely on the knowledge of exam questions and exam skills. Our 156-587 training quiz has bountiful content that can fulfill your aims at the same time. We know high efficient 156-587 practice materials play crucial roles in your review. Our experts also collect with the newest contents of 156-587 Study Guide and have been researching where the exam trend is heading and what it really want to examine you.

FreeCram Check Point Certified Troubleshooting Expert - R81.20 Certification Exam come in three different formats so that the users can choose their desired design and prepare Check Point Certified Troubleshooting Expert - R81.20 (156-587) exam according to their needs. The first we will discuss here is the PDF file of real Check Point Certified Troubleshooting Expert - R81.20 (156-587) exam questions. It can be taken to any place via laptops, tablets, and smartphones. In addition, you can print these Check Point Certified Troubleshooting Expert - R81.20 (156-587) PDF questions for paper study in this format of FreeCram product frees you from restrictions of time and place as you can study 156-587 exam questions from your comfort zone in your spare time.

156-587 Practice Exams - 156-587 Latest Test Labs

By taking our CheckPoint 156-587 practice exam, which is customizable, you can find and strengthen your weak areas. Additionally, we provide a specialized 24/7 customer support team to assist you with any problems you may run into while using our Check Point Certified Troubleshooting Expert - R81.20 exam questions. Our CheckPoint 156-587 desktop-based practice exam software's ability to be used without an active internet connection is another incredible feature.

CheckPoint 156-587 Exam Syllabus Topics:

Topic	Details
Topic 1	• Advanced Site-to-Site VPN Troubleshooting: This section of the exam measures the skills of Check Point System Administrators and covers troubleshooting site-to-site VPN connections.
Topic 2	• Advanced Identity Awareness Troubleshooting: This section of the exam measures the skills of heck Point Security Consultants and focuses on troubleshooting identity awareness systems.
Topic 3	• Advanced Troubleshooting with Logs and Events: This section of the exam measures the skills of Check Point Security Administrators and covers the analysis of logs and events for troubleshooting. Candidates will learn how to interpret log data to identify issues and security threats effectively.
Topic 4	• Advanced Client-to-Site VPN Troubleshooting: This section of the exam measures the skills of CheckPoint System Administrators and focuses on troubleshooting client-to-site VPN issues.
Topic 5	• Introduction to Advanced Troubleshooting: This section of the exam measures the skills of Check Point Network Security Engineers and covers the foundational concepts of advanced troubleshooting techniques. It introduces candidates to various methodologies and approaches used to identify and resolve complex issues in network environments.
Topic 6	• Advanced Firewall Kernel Debugging: This section of the exam measures the skills of Check Point Network Security Administrators and focuses on kernel-level debugging for firewalls. Candidates will learn how to analyze kernel logs and troubleshoot firewall-related issues at a deeper level.
Topic 7	• Advanced Gateway Troubleshooting: This section of the exam measures the skills of Check Point Network Security Engineers and addresses troubleshooting techniques specific to gateways. It includes methods for diagnosing connectivity issues and optimizing gateway performance.
Topic 8	• Advanced Management Server Troubleshooting: This section of the exam measures the skills of Check Point System Administrators and focuses on troubleshooting management servers. It emphasizes understanding server architecture and diagnosing problems related to server performance and connectivity.

CheckPoint Check Point Certified Troubleshooting Expert - R81.20 Sample Questions (Q19-Q24):

NEW QUESTION # 19
Where will the usermode core files located?

- A. /var/suroot
- B. $CPDIR/var/log/dump/usermode
- C. /var/log/dump/usermode
- D. $FWDIRVar/log/dump/usermode

Answer: B

Explanation:
Usermode core files are generated when a user mode process crashes. They are located in the $CPDIR/var/log/dump/usermode directory on the Security Gateway or Security Management server. The core files can be used to analyze the cause of the crash and troubleshoot the issue. The core files are named according to the process name, date, and time of the crash. For example, cpd_2023_02_03_16_40_55.core is a core file for the cpd process that crashed on February 3, 2023 at 16:40:55

NEW QUESTION # 20
URL Filtering is an essential part of Web Security in the Gateway. For the Security Gateway to perform a URL lookup when a client makes a URL request, where is the sync-request forwarded from if a sync-request is required?

- A. URLF Online Service
- B. RAD User Space
- C. URLF Kernel Client

- D. RAD Kernel Space

Answer: A

NEW QUESTION # 21
After kernel debug with "fw ctl debug" you received a huge amount of information. It was saved in a very large file that is difficult to open and analyze with standard text editors. Suggest a solution to solve this issue.

- A. Use "fw ctl zdebug" because of 1024KB buffer size
- B. Use Check Point InfoView utility to analyze debug output
- C. Reduce debug buffer to 1024KB and run debug for several times
- D. Divide debug information into smaller files. Use "fw ctl kdebug -f -o "filename" -m 25 - s "1024"

Answer: D

NEW QUESTION # 22
For Identity Awareness, what is the PDP process?

- A. UserAuth Database
- B. Log Sifter
- C. Captive Portal Service
- D. Identity server

Answer: D

NEW QUESTION # 23
The two procedures available for debugging in the firewall kernel are
i. fw ctl zdebug
ii. fw ctl debug/kdebug
Choose the correct statement explaining the differences in the two

- A. (i) is used to debug the access control policy only, however (ii) can be used to debug a unified policy
- B. (i) is used on a Security Gateway, whereas (ii) is used on a Security Management Server
- C. (i) is used for general debugging, has a small buffer and is a quick way to set kernel debug flags to getan output via command line whereas (ii) is useful when there is a need for detailed debugging and requires additional steps to set the buffer and get an output via command line
- D. (i) is used to debug only issues related to dropping of traffic, however (ii) can be used for any firewall issue including NATing, clustering etc.

Answer: C

Explanation:
The correct statement explaining the differences between the two procedures for debugging in the firewall kernel is D. (i) is used for general debugging, has a small buffer and is a quick way to set kernel debug flags to get an output via command line whereas (ii) is useful when there is a need for detailed debugging and requires additional steps to set the buffer and get an output via command line.
The command fw ctl zdebug is a shortcut command that sets the kernel debug flags to a predefined value and prints the debug output to the standard output. It is useful for general debugging of common issues, such as traffic drops, NAT, VPN, or clustering. It has a small buffer size and does not require additional steps to start or stop the debugging. However, it has some limitations, such as it cannot be used with SecureXL, it cannot filter the output by chain modules, and it cannot save the output to a file12.
The command fw ctl debug is a command that allows the administrator to set the kernel debug flags to a custom value and specify the chain modules to debug. It is useful for detailed debugging of specific issues, such as policy installation, CoreXL, or Identity Awareness. It has a larger buffer size and can save the output to a file. However, it requires additional steps to start and stop the debugging, such as setting the buffer size, clearing the buffer, dumping the buffer, and resetting the debug flags12.
The command fw ctl kdebug is a command that is used in conjunction with fw ctl debug to dump the kernel debug buffer to the standard output or to a file. It is part of the procedure (ii) for detailed debugging in the firewall kernel12.
The other statements are not correct or relevant for explaining the differences between the two procedures for debugging in the firewall kernel. The command fw ctl zdebug can be used to debug more than just the access control policy, and the command fw ctl debug/kdebug can be used to debug more than just the unified policy. Both commands can be used on both the Security Gateway and the Security Management Server, depending on the issue to be debugged12.
