Free Appian Senior Developer vce dumps & latest ACD201 examcollection dumps

In our study, we found that many people have the strongest ability to use knowledge for a period of time at the beginning of their knowledge. As time goes on, memory fades. Our ACD201 study materials are designed to help users consolidate what they have learned, will add to the instant of many training, the user can test their learning effect in time after finished the part of the learning content, have a special set of wrong topics in our ACD201 Study Materials, enable users to find their weak spot of knowledge in

this function, iterate through constant practice, finally reach a high success rate.

Appian Senior Developer Sample Questions (Q94-Q99):

NEW QUESTION # 94

The synced record type Customer has a one-to-many relationship with the Case record type.

You need to calculate the number of open cases for each customer.

What are two valid methods to accomplish this? (Choose two.)

- A. Within the Customer record type, create a custom field that evaluates in real-time to aggregate related record fields and count the open cases.
- B. Create a sync-time custom record field within the Customer record. Utilize the `a!relatedRecordData()` function to filter open cases and count the number of entries.
- C. Within the Case record type, edit the relationship to the Customer record and select the "Open" status as the grouping filter.
- D. Create a query expression for the Customer record type. Utilize the `a!measure()` function within the aggregation fields to count the related cases in the "Open" status.

Answer: A,B

Explanation:

A real-time custom field in the Customer record type can aggregate and count related open cases.

A sync-time custom record field using `a!relatedRecordData()` can filter and count open cases, making the count available as a synced field.

NEW QUESTION # 95

You need to connect to an external system using OAuth 2.0: SAML Bearer Assertion Flow authentication type, which requests access to an API on behalf of a signed in user.

This standard has the several steps involved with the SAML Bearer Assertion Flow.

Which two steps should you perform? (Choose two.)

- A. Enable the checkbox labeled OAuth 2.0: SAML Bearer Assertion Flow in the Admin Console.
- B. Add required users and groups to OAuth 2.0 SAML Bearer Assertion Users system group.
- C. Upload Client Certificate to Connected System.
- D. Create a Bearer Assertion process flow to authenticate the user.

Answer: B,C

Explanation:

Adding required users and groups to the OAuth 2.0 SAML Bearer Assertion Users system group ensures only authorized users can initiate the authentication flow.

Uploading a client certificate to the Connected System is needed for the assertion and secure communication required by the SAML Bearer Assertion Flow.

NEW QUESTION # 96

A view is created with the primary table PERSON and is joined using a left join with the APPOINTMENT table on the column "PERSON_ID". There is a one-to-many relationship between the PERSON and APPOINTMENT tables.

A Custom Data Type (CDT) and a data store entity have been created based on this view, with the primary key being "PERSON_ID".

Review the data presented in the PERSON and APPOINTMENT tables:

PERSON_ID PERSON_NAME

1101	John Doe
1102	Jane Doe
1103	Richard Doe

APPOINTMENT_ID PERSON_ID STATUS

428	1101	Completed
429	1102	Completed
430	1101	New
431	1103	Completed
432	1101	New
433	1102	New
434	1101	New

Which two statements are true when the following query entity is executed? (Choose two.)

```
alqueryEntity(  
  entity: cons!ABC_PERSON_APPOINTMENT_VIEW_DSE,  
  query: alquery(  
    logicalExpression: alqueryLogicalExpression(  
      operator: "AND",  
      filters: {  
        alqueryFilter(  
          field: "STATUS",  
          operator: "=",  
          value: "New"  
        ),  
        alqueryFilter(  
          field: "PERSON_ID",  
          operator: "=",  
          value: "1101"  
        )  
      }  
    ),  
    pagingInfo: alpagingInfo(  
      startIndex: 1,  
      batchSize: 1,  
      sort: alsortInfo(field: "PERSON_ID")  
    )  
  ),  
  fetchTotalCount: true()  
)  
)
```

- A. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters.
- B. result totalCount is 1
- C. result totalCount is 3
- D. Appian makes one more query to the database(other than the actual query to fetch the data) to get the totalCount based on the applied filters and paging info.

Answer: A,B

Explanation:

Appian makes an additional query to the database (other than the main query for data) to retrieve the totalCount when fetchTotalCount: true() is used.

The result totalCount is 1, as there is only one person (PERSON_ID 1101) being filtered, even though there are multiple "New" appointments for that person; with a CDT based on PERSON_ID as the primary key, only one row is counted per person.

NEW QUESTION # 97

Your client wants to configure user authentication using single sign-on (SSO) in their cloud environment.

Which two authentication types should you use to support this requirement? (Choose two.)

- A. P1EE user authentication
- B. LDAP authentication
- C. Appian authentication
- D. OpenID Connect authentication

Answer: C,D

Explanation:

OpenID Connect authentication supports single sign-on (SSO) by integrating with external identity providers.

Appian authentication can work in conjunction with SSO configurations as part of a hybrid setup or fallback mechanism.

NEW QUESTION # 98

You're designing an expression rule that needs to retrieve employees from a database for a given department and display their full name concatenated with their role in a list for a dropdown field.

Which design approach should you recommend?

- A. Query the data to return all employees. Using `a!forEach()`, for each item in the list, if the employee belongs to the given department, return the employee name and role, otherwise, return a null value.
- B. Query the data to return all employees. Use `wherecontains()` to return the employees for the given department and use `a!forEach()` to return the employee name and role for each item in the list.
- C. Query the data with a filter applied to only return employees for the given department. Using `a!forEach()`, for each item in the list, return the employee name and role.

Answer: C

Explanation:

Querying the data with a filter to return only employees for the given department is the most efficient approach. Then, using `a!forEach()` to concatenate and return the employee name and role meets the dropdown display requirement without unnecessary processing.

NEW QUESTION # 99

.....

By focusing on how to help you more effectively, we encourage exam candidates to buy our ACD201 study braindumps with high passing rate up to 98 to 100 percent all these years. Our experts designed three versions for you rather than simply congregate points of questions into ACD201 Real Questions. Efforts conducted in an effort to relieve you of any losses or stress. So our activities are not just about profitable transactions to occur but enable exam candidates win this exam with the least time and get the most useful contents.
