NEW QUESTION # 51
Match the RAID level with its capacity overhead. (Each option may be used once, more than once, or not at all.)

Answer:

Explanation:

Explanation:
RAID 0: This level has zero overhead from capacity perspective, as it uses all the available disk space for data storage without any redundancy or parity. However, it also has no fault tolerance and if one disk fails, all data is lost12.
RAID 1: This level has capacity of one drive as overhead, as it uses disk mirroring to create an exact copy of data on two or more disks. This provides high reliability and fault tolerance, but reduces the usable disk space by half12.
RAID 5: This level has capacity of one drive as overhead, as it uses disk striping with parity to distribute data and parity blocks across three or more disks. This provides a balance between performance and reliability, as it can tolerate one disk failure without losing data12.
RAID 6: This level has capacity of two drives as overhead, as it uses disk striping with double parity to distribute data and two parity blocks across four or more disks. This provides higher reliability and fault tolerance than RAID 5, as it can tolerate two disk failures without losing data12.

NEW QUESTION # 52
Are HPE Nimble Storage arrays designed for high-performance workloads?

- A. Yes
- B. No

Answer: A

Explanation:
HPE Nimble Storage arrays provide organizations with high-performance storage solutions for both traditional and modern workloads. They leverage advanced technologies, including flash storage and predictive analytics, to deliver high performance, scalability, and availability. HPE Nimble Storage arrays also support integration with other HPE storage solutions, making it easier for organizations to manage their storage resources more effectively.

NEW QUESTION # 53
