Amazon AWS Certified Developer Associate Exam (DVA-C02) Sample Questions (Q261-Q266):

NEW QUESTION # 261

A development team is creating a new application designed to run on AWS. While the test and production environments will run on Amazon EC2 instances, developers will each run their own environment on their laptops.

Which of the following is the simplest and MOST secure way to access AWS services from the local development machines?

- A. Create an IAM user to be shared with the entire development team, provide the development team with the access key.
- B. Create an IAM user for each developer on the team: provide each developer with a unique access key
- C. Set up a federation through an Amazon Cognito user pool.
- D. Use an IAM role to assume a role and execute API calls using the role.

Answer: D

NEW QUESTION # 262

You attempt to store an object in the US-STANDARD region in Amazon S3, and receive a confirmation that it has been successfully stored. You then immediately make another API call and attempt to read this object. S3 tells you that the object does not exist What could explain this behavior?

- A. US-STANDARD uses eventual consistency and it can take time for an object to be readable in a bucket
- B. US-STANDARD imposes a 1 second delay before new objects are readable.
- C. You exceeded the bucket object limit, and once this limit is raised the object will be visible.
- D. Objects in Amazon S3 do not become visible until they are replicated to a second region.

Answer: A

NEW QUESTION # 263

A company is using Amazon Cognito user pools for sign-up and login functionality for a web application. The company is using Amazon RDS for the application's data persistence and is using Amazon API Gateway and AWS Lambda for the application's API functionality. Users must provide their first name, last name, email address, and phone number to sign up. All API endpoints have a Cognito user pool authorizer to guard against unauthenticated requests.

A developer wants to show a personalized welcome screen to users after they log in. The welcome screen needs to show the user's first name and the user's previous login date. According to company policy.

developers who work on the web application cannot store any personally identifiable information in RDS instances.

Which solution should the developer implement to meet these requirements?

- A. After successful login, submit a Cognito request for user tokens. When redirecting to the welcome screen, provide the identity token in the Authorization header of the request. Extract the user name from the given_name claim and the user's universally unique identifier (UUID) from the iss claim inside the identity token. Use the UUID as the key to store and retrieve the previous login information from the database.
- B. After successful login, submit a Cognito request for user tokens. When redirecting to the welcome screen, provide the identity token in the Authorization header of the request. Extract the user name from the given_name claim and the user's universally unique identifier (UUID) from the sub claim inside the identity token. Use the UUID as the key to store and retrieve the previous login information from the database.
- C. After successful login, submit a Cognito request for user tokens. When redirecting to the welcome screen, provide the access token in the Authorization header of the request. Extract the user name from the given_name claim and the user's universally unique identifier (UUID) from the sub claim inside the access token. Use the UUID as the key to store and retrieve the previous login information from the database.
- D. After successful login, submit a Cognito request for user tokens. When redirecting to the welcome screen, provide the access token in the Authorization header of the request. Extract the user name from the given name claim and the user's universally unique identifier (UUID) from the iss claim inside the access token. Use the UUID as the key to store and retrieve the previous login information from the database.

Answer: A

NEW QUESTION # 264

A developer is creating a serverless orchestrator that performs a series of steps to processes incoming loT data.

The orchestrator transforms the data, performs a series of calculations, and stores the results in Amazon DynamoDB. The entire process is completed in less than a minute.

The orchestrator must process tens of thousands of transactions each second. The orchestrator must not miss a transaction and must process each transaction at least once.

Which solution will meet these requirements MOST cost-effectively?

- A. Use AWS Step Functions to process the data as Asynchronous Express Workflows.
- B. Use AWS Step Functions to process the data as Standard Workflows.
- C. Use Amazon Simple Notification Service (Amazon SNS) to process the data through an HTTP or HTTPS endpoint.
- D. Use AWS Step Functions to process the data as Synchronous Express Workflows.

Answer: A

NEW QUESTION # 265

A developer is designing a distributed application built using a microservices architect spanning multiple AWS accounts.

The company's operations team wants to analyze and debug application issues from a centralized account.

How can the developer meet these requirements?

- A. Use an Amazon X-Ray agent with role assumption on to publish data into the centralized account.
- B. Use Amazon X-Ray and create a new IAM user to publish the access keys into the centralized account.
- C. Use VPC Flow Logs to collect application logs across different accounts.
- D. Enable AWS CloudTrail to publish the trails in an Amazon S3 bucket in the centralized account.
