

Try UpdateDumps CWNP CWNA-109 Practice Test Software

2026 Latest UpdateDumps CWNA-109 PDF Dumps and CWNA-109 Exam Engine Free Share: https://drive.google.com/open?id=1VYLTpOPDcLpbUfM5whZGgA16Z1_azEwo

We hope to meet the needs of customers as much as possible. If you understand some of the features of our CWNA-109 practice engine, you will agree that this is really a very cost-effective product. And we have developed our CWNA-109 Exam Questions in three different versions: the PDF, Software and APP online. With these versions of the CWNA-109 study braindumps, you can learn in different conditions no matter at home or not.

CWNP CWNA-109 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">RF Validation and WLAN remediation: This topic covers RF interference, WLAN performance, the basic features of validation tools, and common wireless issues.
Topic 2	<ul style="list-style-type: none">WLAN Regulations and Standards: The topic discusses the roles of WLAN and networking industry organizations. It also addresses the concepts of various Physical Layer (PHY) solutions, spread spectrum technologies, and 802.11 WLAN functional concepts.
Topic 3	<ul style="list-style-type: none">WLAN Network Security: It addresses the concepts of weak security options, security mechanisms for enterprise WLANs, and security options and tools used in wireless networks.

Enhance Your Preparation with CWNP CWNA-109 Practice Test Engine

Through the CWNP Certification CWNA-109 Exam method has a lot of kinds, spend a lot of time and energy to review the

CWNP certification CWNA-109 exam related professional knowledge is a kind of method, through a small amount of time and money UpdateDumps choose to use the pertinence training and exercises is also a kind of method.

CWNP Wireless Network Administrator (CWNA) Sample Questions (Q124-Q129):

NEW QUESTION # 124

Lynne runs a small hotel, and as a value added service for his customers he has implemented a Wi-Fi hot-spot. Lynne has read news articles about how hackers wait at hot-spots trying to take advantage of unsuspecting users. He wants to avoid this problem at his hotel.

What is an efficient and practical step that Lynne can take to decrease the likelihood of active attacks on his customers' wireless computers?

- **A. Enable station-to-station traffic blocking by the access points in the hotel.**
- B. Require EAP-FAST authentication and provide customers with a username/password on their receipt.
- C. Implement Network Access Control (NAC) and require antivirus and firewall software along with OS patches.
- D. Implement an SSL VPN in the WLAN controller that initiates after HTTPS login.

Answer: A

Explanation:

In a public Wi-Fi hotspot, like the one Lynne runs in his hotel, ensuring customer security against active attacks is crucial. Active attacks involve unauthorized access, eavesdropping, or manipulation of the network traffic. To mitigate such threats, an effective and practical step is:

* Station-to-Station Traffic Blocking: Also known as client isolation, this feature prevents direct communication between devices connected to the Wi-Fi network. By enabling this on the access points, Lynne can significantly decrease the likelihood of active attacks like man-in-the-middle (MITM) attacks, where an attacker intercepts and possibly alters the communication between two parties.

The other options, while beneficial for network security, might not be as straightforward or practical for Lynne's situation:

* Network Access Control (NAC) requires a more complex infrastructure and management, which might not be ideal for a small hotel setup.

* Implementing an SSL VPN adds an extra layer of security but might complicate the login process for users, potentially affecting the user experience.

* Requiring EAP-FAST authentication provides secure authentication but may not be feasible for transient customers who expect quick and easy network access.

Therefore, enabling station-to-station traffic blocking is a practical and efficient measure that Lynne can implement to enhance customer security on the Wi-Fi network.

NEW QUESTION # 125

802.11ax (HE) introduces Resource Units that can be used to allow communications with multiple devices at the same time, on the same channel, in the same BSS. What feature of 802.11ax provides this functionality?

- A. Wi-Fi-LTE
- B. TWT
- C. 6 GHz support
- **D. OFDMA**

Answer: D

Explanation:

The feature of 802.11ax (HE) that provides this functionality is OFDMA. OFDMA stands for Orthogonal Frequency Division Multiple Access and is a technology that allows multiple devices to communicate simultaneously on the same channel in the same BSS. OFDMA works by dividing a channel into smaller subchannels called Resource Units (RUs), which are composed of groups of subcarriers or tones. Each RU can be assigned to a different device based on its bandwidth requirement and signal quality. This way, OFDMA can increase the efficiency and capacity of the channel by reducing overhead, contention, and latency.

OFDMA can also support both uplink and downlink multi-user transmissions using trigger frames and buffer status reports. 6 GHz

support, TWT, and Wi-Fi-LTE are not features of 802.11ax that provide this functionality. References: [CWNP Certified Wireless Network Administrator Official Study Guide: ExamCWNA-109], page 226; [CWNA: Certified Wireless Network Administrator Official Study Guide: ExamCWNA-109], page 216.

NEW QUESTION # 126

What is the most effective method for testing roaming in relation to 802.11 VoIP handsets?

- A. Use the built-in roaming monitor built into all VoIP handsets.
- B. Use a protocol analyzer to capture the traffic generated when a laptop roams.
- C. Use a spectrum analyzer to monitor RF activity during a VoIP call.
- **D. Place a call with the handset and move around the facility to test quality during roaming.**

Answer: D

Explanation:

The most effective method for testing roaming in relation to 802.11 VoIP handsets is to place a call with the handset and move around the facility to test quality during roaming. This method allows you to evaluate the actual performance and user experience of VoIP calls over wireless networks, as well as identify any potential issues such as signal strength, interference, latency, jitter, packet loss, or handoff delays. A spectrum analyzer can only show you the RF activity during a VoIP call, but not how it affects the voice quality or roaming behavior. A protocol analyzer can capture the traffic generated when a laptop roams, but it cannot simulate the characteristics of a VoIP handset such as battery life, antenna design, codec support, or QoS features. A built-in roaming monitor is not a common feature in all VoIP handsets, and it may not provide accurate or comprehensive information about the roaming process. References: [CWNP Certified Wireless Network Administrator Official Study Guide: ExamCWNA-109], page 487; [Voice over Wireless LAN 4.1 Design Guide], page 6-19.

NEW QUESTION # 127

In a mesh BSS (MBSS), according to the 802.11 standard, what device connect the mesh to an Ethernet network?

- **A. Mesh Portal**
- B. Mesh Switch
- C. Mesh Gate
- D. Mesh Router

Answer: A

Explanation:

a mesh portal is a device that connects a mesh BSS (MBSS) to an Ethernet network, such as the Internet. A mesh portal acts as a bridge between the wired and wireless domains, and allows the mesh stations to communicate with external networks. A mesh portal is also a mesh point, which means it can forward traffic within the MBSS.

The other options are not correct. Option A. Mesh Gate is a device that connects a mesh BSS (MBSS) to another mesh BSS or another wireless network, such as an infrastructure BSS or an ad hoc network2. A mesh gate acts as a gateway between different wireless domains, and allows the mesh stations to communicate with other wireless networks. A mesh gate is also a mesh point, which means it can forward traffic within the MBSS. Option B. Mesh Switch is not a valid term in the 802.11 standard. Option C. Mesh Router is also not a valid term in the 802.11 standard.

NEW QUESTION # 128

You are reconfiguring an AP to use the short guard interval. How long will the new guard interval duration be after the change?

- A. 104 ns
- **B. 400 ns**
- C. 800 ns
- D. 10 ms

Answer: B

Explanation:

The short guard interval is an optional feature of 802.11n and 802.11ac that reduces the time between OFDM symbols from 800 ns

to 400 ns. This can increase the data rate by about 11%, but also requires more precise timing and synchronization between the transmitter and the receiver. The short guard interval is only used when both the AP and the client support it and agree to use it.
